(57) **ABSTRACT**

The present invention relates to novel methods for the prevention, treatment and diagnosis of Alzheimer's disease. In addition, the invention relates to methods for assessing an individual's susceptibility or pre-disposition to Alzheimer's disease. The methods of the present invention involve the use of therapeutic targets and diagnostic and/or predictive markers within the mTOR signalling pathway. The methods also involve screening subjects for genetic polymorphisms associated with rapamycin-sensitive genes.

THERAPEUTIC TARGETS FOR
ALZHEIMER'S DISEASE

This application is a §371 national phase entry of International Patent Application PCT/GB2013/051843, filed 11 Jul. 2013, which claims priority to GB Patent Application No. 1212334.5 filed Jul. 11, 2012, the entire contents of each being incorporated by reference herein as though set forth in full.

FIELD OF THE INVENTION

The present invention relates to novel strategies for the prevention, treatment and diagnosis of Alzheimer's disease. In addition, the invention relates to strategies for assessing an individual's susceptibility or pre-disposition to Alzheimer's disease. In particular, the present invention relates to methods involving the use of therapeutic targets and diagnostic and/or predictive markers within the mTOR signaling pathway.

BACKGROUND TO THE INVENTION

Alzheimer's disease is the most common form of dementia in older people. As a result of population aging worldwide, the prevalence of this disease is set to increase significantly in coming years. As such, there is an urgent need to develop better prognostic and diagnostic tools and new treatments for people identified as having this disease.

Alzheimer's disease is a chronic neurodegenerative disorder characterised by selective loss of cortical neurons within the hippocampus and the temporal and frontal lobes of the brain. The neurodegenerative process occurring in Alzheimer's disease is accompanied by progressive cognitive impairment leading ultimately to dementia in affected individuals.

There is currently no accepted "gold standard" diagnostic test for Alzheimer's disease in the live patient. This reflects the difficulties associated with identifying patients who would go on to be classified as having this disease at post mortem examination. Clinical diagnosis of Alzheimer's disease is typically based on evaluation of clinical criteria, such as the NINCDS/ADRDA criteria (McKhann, G. et al., (1984) *Neurology* 34: 939-944).

The problem with the diagnostic methods used to date lies in the fact that patients are typically diagnosed once clinical dementia has started to develop. It follows therefore, that existing treatment strategies are limited to agents used primarily to manage the symptoms of disease. For example, cholinesterase inhibitors are administered to patients so as to block the degradation of the neurotransmitter acetylcholine and thereby enhance neurotransmission in the brain. Use of such agents can help to preserve cognitive function, but does not improve the underlying pathology and is therefore not a curative approach.

Although the etiology of Alzheimer's disease is poorly understood, the neuropathology associated with the development of this disease has been relatively well characterised. The classical hallmarks of this disease consist of amyloid- β plaques, which accumulate in the brain, and neurofibrillary tangles (NFT) consisting of hyperphosphorylated tau protein present in affected neurons. Additional changes occurring at the cellular level, which are now thought to precede the deposition of plaques and NFTs, include damage to cells caused by oxidative stress, mitochondrial malfunction and aberrant re-entry of neurons into the cell division cycle.

2

In addition to difficulties associated with diagnosing Alzheimer's disease, there are also problems associated with identifying individuals in the population who are at increased and/or decreased risk of developing Alzheimer's disease during their lifetime, as compared with the average level of risk associated with the general population. The only known genetic risk factor for late onset sporadic form of Alzheimer's disease is the polymorphism on the ApoE gene. Other discovered polymorphisms appear to be restricted to relatively small patient subgroups. Thus risk prediction or assessment of susceptibility, before the development of clinical Alzheimer's disease, is difficult as well.

There is now good evidence to suggest that the neuropathology underlying Alzheimer's disease begins years, maybe even a decade, prior to the diagnosis of clinical dementia (Forlenza et al., (2010) *BMC Medicine* 8:89). Based on these observations, the continuum of Alzheimer's disease progression has been classified into three phases:

- (i) asymptomatic Alzheimer's disease (preclinical stage);
- (ii) mild cognitive impairment (MCI) due to Alzheimer's disease (pre-dementia stage); and
- (iii) clinically-defined Alzheimer's disease (dementia).

In light of the above, there now exist several opportunities for improved management of Alzheimer's disease. In particular, it may be possible to identify individuals at increased risk of developing Alzheimer's disease, and/or diagnose individuals at a much earlier stage of disease, for example, individuals with asymptomatic disease or those patients with MCI that will go on to develop clinically-defined Alzheimer's disease. If susceptible individuals can be identified and/or diagnosed at an earlier stage of disease, it will be possible to develop, test and use new preventative and/or curative treatments intended to stabilize and/or reverse the neurodegenerative process and thereby prevent cognitive decline.

Researchers are already using the improved knowledge of Alzheimer's disease pathogenesis to develop more effective methods of diagnosis and treatment. In this regard, diagnostic biomarkers have been identified that can be measured in humoral fluids, mainly cerebrospinal fluids, and biomarkers that may be detected using advanced neuroimaging methods (Gustaw-Rothenberg et al., (2010) *Biomark. Med.* 4(1):15-26).

Furthermore, new "disease-modifying" treatments are being developed that tackle the deposition of β -amyloid plaques and NFTs (Bonda et al., (2010) *Curr. Opin. Drug Discov Devel.* 13(2): 235-246)

There remains however, an ongoing need to improve methods for the diagnosis and treatment of Alzheimer's disease, particularly early-stages of disease. The present invention seeks to address these issues.

SUMMARY OF INVENTION

The present invention is directed towards new methods of preventing, treating and diagnosing Alzheimer's disease based on the use of novel gene targets linked to this disease. The invention also relates to screening methods for identifying individuals that are pre-disposed to Alzheimer's disease, based on the use of novel gene targets.

The gene targets presented herein are classified as "rapamycin-sensitive" genes for the reason that their cellular expression is affected by the compound rapamycin. The group of rapamycin-sensitive genes to which the present invention relates were found to be deregulated in the brains of patients diagnosed with Alzheimer's disease, as compared with control samples, using microarray expression analysis.

Rapamycin is known to inhibit the serine/threonine kinase mTOR and thereby reduce signalling downstream of this protein therefore the present invention is directed in particular, to the use of novel therapeutic and diagnostic targets within the mTOR signalling pathway in the context of methods for the prevention, treatment and diagnosis of Alzheimer's disease.

In a first aspect, the present invention provides a method for the prevention and/or treatment of Alzheimer's disease in a subject, comprising administering to the subject a pharmacological agent which modulates one or more targets within the mTOR signalling pathway of a cell, wherein the target is selected from:

- (i) the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5;
- (ii) the transcriptional products of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, or fragments thereof; and
- (iii) the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, or fragments thereof.

In a second aspect, the invention provides a method of screening for pharmacological agents useful in the prevention and/or treatment of Alzheimer's disease in a subject, wherein said method comprises:

- (i) contacting a cell with a test pharmacological agent;
- (ii) measuring either the expression level of one or more of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, or the level or activity of one or more of the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5;
- (iii) measuring either the expression level of one or more of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, or the level or activity of one or more of the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5 in a control cell not exposed to the test pharmacological agent;
- (iv) comparing the results determined in steps (ii) and (iii) wherein a difference in the expression level of one or

more of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, or the level or activity of one or more of the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, indicates that the test pharmacological agent is suitable for use in the prevention and/or treatment of Alzheimer's disease.

In a third aspect, the invention provides a method to assist with diagnosis of Alzheimer's disease in a live human subject, which method comprises the steps of:

- (i) measuring either the expression level of one or more of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, and/or the activity of one or more of the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5;
- (ii) comparing the expression level and/or activity measured in (i) with reference/control values, wherein a difference in expression level of one or more of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, and/or the level or activity of one or more of the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5 is indicative of Alzheimer's disease.

In a fourth aspect, the invention provides a method of assessing the risk of Alzheimer's disease progression in a human subject, which method comprises the steps of:

- (i) measuring either the expression level of one or more of the rapamycin-sensitive genes shown in Tables 2, 3, 4

and 5, and/or the activity of one or more of the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5;

- (ii) comparing the expression level and/or activity measured in (i) with reference/control values,

wherein a difference in expression level and/or activity of the one or more rapamycin sensitive genes shown in Tables 2, 3, 4 and 5 is indicative of Alzheimer's disease progression.

In a fifth aspect, the invention provides a method for screening a human subject for pre-disposition to Alzheimer's disease, which method comprises the steps of:

- (i) measuring either the expression level of one or more of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, and/or the activity of one or more of the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5;
- (ii) comparing the expression level and/or activity measured in (i) with reference/control values,

wherein a difference in expression level and/or activity of the one or more rapamycin sensitive genes shown in Tables 2, 3, 4 and 5 is taken to mean the subject is pre-disposed to Alzheimer's disease.

In all aspects of the invention described above, in preferred embodiments, the one or more targets within the mTOR signalling pathway is/are selected from the group of rapamycin-sensitive genes consisting of calcium channel, voltage-dependent, L type, alpha 1D subunit (CACNA1 D), gamma-aminobutyric acid B receptor, 2 (GABBR2), homeobox D10 (HOXD10), Kruppel-like factor 2 (KLF2), rhodopsin (RHO) and GLI zinc finger family 2 (GLI2).

The present invention is also directed to methods for identifying human subjects that are pre-disposed to Alzheimer's disease, and methods to assist with diagnosis of Alzheimer's disease in live human subjects based on the use of polymorphisms, particularly single nucleotide polymorphisms (SNPs), in the rapamycin-sensitive genes described herein. Methods are also described based on the use of polymorphisms within genes which affect the expression of rapamycin-sensitive genes.

Therefore, in a sixth aspect, the invention provides a method of screening a human subject for pre-disposition to Alzheimer's disease, which method comprises genotyping the subject for one or more polymorphisms in one or more of the rapamycin-sensitive genes shown in Table 1, wherein the presence of at least one variant allele associated with Alzheimer's disease is an indication that the subject is pre-disposed to Alzheimer's disease.

In a seventh aspect, the invention provides a method of screening a human subject for pre-disposition to Alzheimer's disease, which method comprises genotyping the subject for one or more polymorphisms in one or more genes which affect the expression of one or more of the rapamycin-sensitive genes shown in Table 1, wherein the presence of at least one variant allele associated with Alzheimer's disease is an indication that the subject is pre-disposed to Alzheimer's disease.

In an eighth aspect, the invention provides a method to assist with diagnosis of Alzheimer's disease in a live human subject, which method comprises genotyping the subject for one or more polymorphisms in one or more of the rapamycin-sensitive genes shown in Table 1, or a polymorphism in one or more genes which affect the expression of one or more of the rapamycin-sensitive genes shown in Table 1, wherein the presence of at least one variant allele associated with Alzheimer's disease is indicative of Alzheimer's disease.

In a ninth aspect, the invention provides an array or kit for detecting genetic polymorphisms in a sample taken from a subject wherein the array or kit comprises reagents for the detection of one or more polymorphisms in one or more of the rapamycin-sensitive genes shown in Table 1, or one or more polymorphisms in one or more genes which affect the expression of one or more of the rapamycin-sensitive genes shown in Table 1.

The present invention is also concerned with polymorphisms that may be used to monitor the mTOR signalling pathway in a cell. These polymorphisms are associated with the differential sensitivity of cells to the G1/S inhibitor rapamycin.

Therefore, in a further aspect, the invention provides a method by which to monitor mTOR signalling in a human cell, which method comprises detecting one or more polymorphisms in one or more of the rapamycin-sensitive genes shown in Table 1, or one or more polymorphisms in one or more genes which affect the expression of one or more of the rapamycin-sensitive genes shown in Table 1, wherein the presence of at least one variant allele associated with a differential response to rapamycin is indicative of the status of mTOR signalling in the cell.

In all aspects of the invention relating to polymorphisms described above, in preferred embodiments, the one or more, two or more, three or more, four or more, five or more, six or more, seven or more, eight or more, nine or more, ten or more polymorphisms for the purposes of genotyping or detection are in one or more of the rapamycin-sensitive genes selected from LILRB2, FAM5C, CRP, CLU, FCGR2A, CD1E, FAM5C, LPL, SYK and CUX1 and/or in one or more of the genes which affect the expression of one or more rapamycin-sensitive genes, selected from POU2F1, ADRA1A, PRDM1 and LOXL2.

In further preferred embodiments, the one or more, two or more, three or more, four or more, five or more, six or more, seven or more, eight or more, nine or more, ten or more polymorphisms is/are selected from the group consisting of:

- (i) the single polynucleotide polymorphisms: rs798893, rs725106, rs1341665, rs1359059, rs1532278, rs1801274, rs2036108, rs811925, rs883524, rs1065457, rs1148613, rs295, rs290258, rs365836 and rs569214; and
- (ii) any polymorphism in linkage disequilibrium with the single nucleotide polymorphisms of (i).

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 Cell cycle dependent expression of phosphor-tau (p-tau) in SH-SY5Y neuroblastoma cells. White bars=G1; Black bars=G2.

FIG. 2 Effect of rapamycin on cell cycle kinetics in SH-SY5Y neuroblastoma cells. Vertically-shaded bars=G1 population; Horizontally-shaded bars=G2 population; Lighter shading=control cells treated with culture medium; Darker shading=cells treated with 100 ng/ml rapamycin.

FIG. 3 Effect of rapamycin on p-tau expression in SH-SY5Y neuroblastoma cells. Grey bars=all single cells; Vertically-shaded bars=G1 population; Horizontally-shaded bars=G2 population; Lighter shading=control cells treated with culture medium; Darker shading=cells treated with 100 ng/ml rapamycin. All data are normalised to Control (100%).

FIG. 4 Effect of siRNA-mediated down-regulation of CACNA1 D on cell cycle kinetics in SH-SY5Y neuroblastoma cells. Vertically-shaded bars=G1 population; Horizontally-shaded bars=G2 population; Lighter shading=cells

treated with Culture medium, siRNA Control and CACNA1 D siRNA alone; Darker shading=cells treated with additional 100 ng/ml rapamycin.

FIG. 5 Effect of siRNA-mediated down-regulation of CACNA1 D on p-tau expression in SH-SY5Y neuroblastoma cells. Grey bars=all single cells; Vertically-shaded bars=G1 population; Horizontally-shaded bars=G2 population; Lighter shading=cells treated with Culture medium, siRNA Control and CACNA1 D siRNA alone; Darker shades represent cells treated with additional 100 ng/ml rapamycin. All data are normalised to Control (100%).

FIG. 6 Effect of siRNA-mediated down-regulation of GABBR2 on cell cycle kinetics in SH-SY5Y neuroblastoma cells. Vertically-shaded bars=G1 population; Horizontally-shaded bars=G2 population; Lighter shading=cells treated with Culture medium, siRNA Control and GABBR2 siRNA alone; Darker shading=cells treated with additional 100 ng/ml rapamycin.

FIG. 7 Effect of siRNA-mediated down-regulation of GABBR2 on p-tau expression in SH-SY5Y neuroblastoma cells. Grey bars=all single cells; Vertically-shaded bars=G1 population; Horizontally-shaded bars=G2 population; Lighter shading=cells treated with Culture medium, siRNA Control and GABBR2 siRNA alone; Darker shades represent cells treated with additional 100 ng/ml rapamycin. All data are normalised to Control (100%).

FIG. 8 Effect of siRNA-mediated down-regulation of HOXD10 on cell cycle kinetics in SH-SY5Y neuroblastoma cells. Vertically-shaded bars=G1 population; Horizontally-shaded bars=G2 population; Lighter shading=cells treated with Culture medium, siRNA Control and HOXD10 siRNA alone; Darker shading=cells treated with additional 100 ng/ml rapamycin.

FIG. 9 Effect of siRNA-mediated down-regulation of HOXD10 on p-tau expression in SH-SY5Y neuroblastoma cells. Grey bars=all single cells; Vertically-shaded bars=G1 population; Horizontally-shaded bars=G2 population; Lighter shading=cells treated with Culture medium, siRNA Control and HOXD10 siRNA alone; Darker shades represent cells treated with additional 100 ng/ml rapamycin. All data are normalised to Control (100%).

FIG. 10 Effect of siRNA-mediated down-regulation of KLF2 on cell cycle kinetics in SH-SY5Y neuroblastoma cells. Vertically-shaded bars=G1 population; Horizontally-shaded bars=G2 population; Lighter shading=cells treated with Culture medium, siRNA Control and KLF2 siRNA alone; Darker shading=cells treated with additional 100 ng/ml rapamycin.

DETAILED DESCRIPTION

The present invention is directed to methods for preventing, treating and/or diagnosing Alzheimer's disease in live human subjects involving use of gene targets within the "mTOR signalling pathway".

The kinase, "mTOR", functions within the context of two cytoplasmic protein complexes known as mTORC1 and mTORC2. It is however, only the mTORC1 complex that is sensitive to the inhibitor rapamycin. Thus, the targets of interest in the present invention may also be classified as targets within the mTORC1 signalling pathway.

The cytoplasmic kinase mTOR is stimulated or activated by a wide variety of upstream signals. These include signals generated or triggered as a result of nutrient sensing, hypoxia, and/or the activity of growth factors and their cognate receptors. Activation of mTOR upregulates its kinase activity and thereby increases mTOR-mediated phosphorylation of downstream protein targets within the cell. In most cases, the direct downstream protein targets of mTOR interact with a variety of further molecular targets, and in doing so, stimulate a wide variety of cellular responses, such as increased protein synthesis and the promotion of cell growth and proliferation. The chain of molecular events triggered downstream of mTOR-mediated phosphorylation of its direct protein targets is defined herein as the "mTOR signalling pathway", and the target genes/proteins of the present invention fall within this pathway.

In the methods of the present invention, the particular targets of interest within the mTOR signalling pathway are selected from the genes shown in Tables 2, 3, 4 and 5. The term "target" is intended to encompass the genes of Tables 2, 3, 4 and 5, the transcriptional products of such genes and the proteins encoded by such genes.

The particular genes shown in Table 1 are "rapamycin-sensitive" for the reason that their cellular expression is affected (increased or decreased) by the compound rapamycin. Since rapamycin is known to inhibit the serine/threonine kinase mTOR in (human) cells, and thereby reduce signalling downstream of this protein, the genes shown in Tables

2, 3, 4 and 5 are grouped herein as targets within the mTOR signalling pathway. Tables 2 and 4 show the rapamycin-sensitive genes that have an altered expression in the brain of Alzheimer's patients with mild disease and Tables 3 and 5 show the rapamycin-sensitive genes that have an altered expression in the brain of Alzheimer's patients with advanced disease.

Therapeutic Methods

In a first aspect, the present invention provides methods for the prevention and/or treatment of live human subjects diagnosed with Alzheimer's disease involving administration of pharmacological agents which modulate or are capable of modulating one or more, two or more, three or more, four or more etc. targets within the mTOR signalling pathway.

In certain embodiments, the therapeutic target is selected from the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5 and the pharmacological agent will typically modulate the target via effects at the level of gene expression. In preferred embodiments, the one or more targets within the mTOR signalling pathway is/are selected from the group of rapamycin-sensitive genes consisting of calcium channel, voltage-dependent, L type, alpha 1D subunit (CACNA1 D), gamma-aminobutyric acid B receptor, 2 (GABBR2), homeobox D10 (HOXD10), Kruppel-like factor 2 (KLF2), rhodopsin (RHO) and GLI zinc finger family 2 (GLI2).

In certain embodiments, the pharmacological agent may act by up-regulating/increasing or down-regulating/decreasing expression of the target gene. Gene expression may be detected at the level of the transcriptional product or at the level of the protein produced, using standard techniques described herein below. Up-regulation or down-regulation of gene expression is measured relative to the situation in the absence of pharmacological agent, or in the presence of an appropriate, inactive control.

In certain embodiments of the invention, the term "target" may be used to refer to the transcriptional products of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, or fragments thereof. The term "transcriptional product" is intended to encompass the pre-mRNA species generated following transcription of the gene, any of the splice intermediates generated during pre-mRNA processing and the mature fully-spliced mRNA species. Inhibition of such transcriptional products may involve down-regulating the level of such products, for example, by promoting nucleic acid degradation. This may be mediated for example, by interfering RNA species, such as siRNAs.

In certain other embodiments of the invention, the "target" may refer to the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, or fragments thereof. The pharmacological agent may therefore bring about an increase or decrease in the level of protein within a cell or an increase or decrease in the biological activity of the protein.

As noted above, the target of the invention may include a fragment of the transcriptional product of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5 or a fragment of a protein encoded by one or more of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5. The term "fragment" should be taken to mean a form of the transcriptional product or protein, which is reduced in length by one or more, two or more, three or more, four or more etc. nucleotides or amino acids, respectively, as compared with the full-length transcriptional product or protein. In relation to post-transcriptional products, the term "fragment" may also be applied to alternatively-spliced forms of mRNA produced from the originating pre-mRNA transcript.

In the context of the present invention, the term “modulates” is used very broadly to mean an agent capable of changing or altering the expression of a gene, the production and/or level of a transcriptional product of a gene and/or the production, level and/or activity of a protein encoded by a gene. The term “modulates” may be used to describe an increase or a decrease in any of the parameters described above. Any increase or decrease is measured relative to the situation present in the absence of the pharmacological agent or in the presence of a suitable inactive control.

In one embodiment, the pharmacological agent is an activator or agonist capable of increasing or up-regulating the expression of a gene, the production and/or level of a transcriptional product of a gene and/or the production, level and/or activity of a protein encoded by a gene. In an alternative embodiment, the pharmacological agent is an inhibitor or antagonist capable of decreasing or down-regulating the expression of a gene, the production and/or level of a transcriptional product of a gene and/or the production, level and/or activity of a protein encoded by a gene.

Classes of pharmacological agents suitable for use in accordance with the methods described herein would be available to those skilled in the art. Such agents include but are not limited to small molecules, organic or inorganic molecules, biological molecules including antibodies and antigen binding fragments thereof, natural or synthetic polypeptides or peptides, nucleic acid therapeutic agents including antisense RNA species and double-stranded RNA species for use as RNA interfering agents, for example siRNA molecules.

In the context of the present invention, the term antibody covers native immunoglobulins from any species, chimeric antibodies, humanised antibodies, F(ab')2 fragments, Fab fragments, Fv fragments, sFv fragments and highly related molecules such as those based upon antibody domains which retain specific binding affinity (for example, single domain antibodies).

Pharmacological agents may be formulated as compositions for delivery wherein the agent in a suitable dosage form is combined with a pharmaceutically acceptable carrier such as a diluent, filler, salt, buffer, stabilizer, solubilizer etc. The dosage form may contain other pharmaceutically acceptable excipients for modifying conditions such as pH, osmolarity, taste, viscosity, sterility, lipophilicity, solubility etc.

Suitable dosage forms include solid dosage forms, for example, tablets, capsules, powders, dispersible granules, cachets and suppositories, including sustained release and delayed release formulations. Powders and tablets will generally comprise from about 5% to about 70% active ingredient. Suitable solid carriers and excipients are generally known in the art and include, e.g. magnesium carbonate, magnesium stearate, talc, sugar, lactose, etc. Tablets, powders, cachets and capsules are all suitable dosage forms for oral administration.

Liquid dosage forms include solutions, suspensions and emulsions. Liquid form preparations may be administered by intravenous, intracerebral, intraperitoneal, parenteral or intramuscular injection or infusion. Sterile injectable formulations may comprise a sterile solution or suspension of the active agent in a non-toxic, pharmaceutically acceptable diluent or solvent. Suitable diluents and solvents include sterile water, Ringer's solution and isotonic sodium chloride solution, etc. Liquid dosage forms also include solutions or sprays for intranasal administration.

Aerosol preparations suitable for inhalation may include solutions and solids in powder form, which may be combined with a pharmaceutically acceptable carrier, such as an inert compressed gas.

Also encompassed are dosage forms for transdermal administration, including creams, lotions, aerosols and/or emulsions. These dosage forms may be included in transdermal patches of the matrix or reservoir type, which are generally known in the art.

Pharmaceutical preparations may be conveniently prepared in unit dosage form, according to standard procedures of pharmaceutical formulation. The quantity of active compound per unit dose may be varied according to the nature of the active compound and the intended dosage regime.

Generally this will be within the range 0.1 mg to 1000 mg.

Wherein the pharmacological agent consists of a nucleic acid therapeutic agent, for example, an antisense RNA species or a double-stranded RNA species for use as an RNA interfering agent, the active agent may be administered to a patient in need thereof via gene therapy approaches.

The rapamycin-sensitive target genes shown in Tables 2, 3, 4 and 5 encode a range of proteins including enzymes, receptors and transporters. Preferred known pharmacological agents for use in conjunction with the present methods include the following; however, this is not to be construed as limiting the invention to these specific embodiments.

Wherein the target gene is CACNA1 D, pharmacological agents for use may include MEM-1003, clevidipine butyrate, aliskiren/amldipine/hydrochlorothiazide, mibepradil, bepridil, nisoldipine, isradipine, amlodipine and/or nicardipine.

Wherein the target gene is HDAC5, pharmacological agents for use may include tributyrin, belinostat, pyroxamide, vorinostat and/or romidepsin.

Wherein the target gene is IL6, pharmacological agents for use may include tocilizumab.

Wherein the target gene is NR3C1, pharmacological agents for use may include rimexolone, medrysone, clocoartolone pivalate, diflorsone diacetate, fluorometholone, dexamethasone phosphate, cortisone acetate, halcinonide, flurandrenolide, desoximetasone, desonide, prednisolone, clobetasol propionate, fluocinolone acetonide, prednisone, hydrocortisone, triamcinolone, dexamethasone 21-acetate, 11beta hydrocortisone acetate, betamethasone, dexamethasone, budesonide, fluticasone, beclomethasone dipropionate, acetic acid/hydrocortisone, betamethasone acetate/betamethasone phosphate, betamethasone acetate, triamcinolone acetonide, ciprofloxacin/hydrocortisone, dexamethasone/neomycin/polymyxin B, ciprofloxacin/dexamethasone, ORG 34517, ciclesonide, betamethasone dipropionate/calcipotriene, fluticasone furoate, budesonide/formoterol, difluprednate, formoterol/mometasone furoate, clotrimazole/betamethasone dipropionate, fluticasone/salmeterol, dexamethasone/tobramycin, clotrimazole/betamethasone, miconazole, prednisolone acetate, clioquinol/hydrocortisone, methylprednisolone acetate, mometasone furoate, amcinonide, methylprednisolone succinate, betamethasone phosphate, fluocinonide, prednicarbate, hydrocortisone cypionate, hydrocortisone succinate, prednisolone phosphate, betamethasone valerate, betamethasone benzoate, fludrocortisone acetate, prednisolone tebutate, betamethasone dipropionate, hydrocortisone buteprate, alclometasone dipropionate, hydrocortisone butyrate, fluorometholone acetate, hydrocortisone valerate, nystatin/

triamicinolone acetonide, loteprednol etabonate, hydrocortisone phosphate, methylprednisolone, halobetasol propionate, flunisolide and/or mifepristone.

11

Wherein the target gene is NTSR1, pharmacological agents for use may include contulakin-G.

Wherein the target gene is PRKCH, pharmacological agents for use may include ingenol 3-angelate.

Wherein the target gene is SCN8A, pharmacological agents for use may include riluzole.

Wherein the target gene is SERPINE1, pharmacological agents for use may include drotrecogin alfa.

Wherein the target gene is TRPV1, pharmacological agents for use may include SB-705498, resiniferatoxin and/or capsaicin.

Wherein the target gene is VEGFA, pharmacological agents for use may include bevacizumab, ranibizumab, afibercept and/or pegaptanib.

Wherein the target gene is GLP1 R, pharmacological agents for use may include liraglutide, T-0632, GLP-1 (7-36) amide and/or exenatide.

The term "Alzheimer's disease" is used herein broadly to mean disease diagnosed on the basis of clinical criteria and/or disease identified on the basis of pathophysiological changes associated with AD.

At present, the diagnosis of Alzheimer's disease in live human subjects is based on the evaluation of clinical criteria, such as the NINCDS/ADRDA criteria (McKhan, G. et al., (1984) Neurology 34: 939-944). However, such diagnostic criteria applied in the clinic are based on the measurement of cognitive parameters, and are thus reliant on the onset of cognitive symptoms in patients with this disease.

It is however, clear from extensive research carried out that the pathophysiological changes defining AD are detectable in individuals years before these patients show any signs of cognitive impairment. Alzheimer's disease has accordingly, been classified into three phases:

- (i) asymptomatic Alzheimer's disease (preclinical stage);
- (ii) mild cognitive impairment (MCI) due to Alzheimer's disease (pre-dementia stage); and
- (iii) clinically-defined Alzheimer's disease (dementia).

In the context of the present invention, the phrase "prevention and/or treatment of Alzheimer's disease" is intended to encompass prevention and/or treatment strategies used for an individual having disease at any one of the three phases defined above.

It is not at present possible to reliably diagnose individuals with asymptomatic AD or early-stage disease; however, as methods of diagnosis improve, it may prove possible to identify individuals with neuropathological changes defining the early stages of AD. The methods described herein may therefore be used to prevent and/or delay the onset of cognitive symptoms in a subject asymptomatic for Alzheimer's disease. This may be achieved by a reversal, stabilisation and/or delay of the neurological changes underlying AD pathology.

The methods provided herein may also be used to prevent and/or delay the onset of AD-associated dementia in individuals who are already symptomatic to varying degrees. For example, the methods of the invention may be applied to individuals classified according to standard criteria, for example the Mayo Clinic diagnostic criteria (Winblad et al., (2004) J. Intern. Med 256: 240-246), as having mild cognitive impairment (MCI). In a further embodiment, the method of the invention may be used to prevent and/or delay the worsening of symptoms in individuals already diagnosed with clinical dementia. The methods of the present invention may therefore be used to treat Alzheimer's disease in a subject exhibiting mild cognitive impairment or in a subject exhibiting clinical dementia.

12

The human subject to be treated according to the methods provided herein may be any human subject diagnosed as having Alzheimer's disease. This includes individuals with early-onset familial Alzheimer's disease and individuals with late-onset sporadic forms of this disease.

Screening Methods

In a second aspect, the present invention also provides methods of screening for pharmacological agents useful in the prevention and/or treatment of Alzheimer's disease in a subject, wherein said method comprises the steps of:

- (i) contacting a cell with a test pharmacological agent;
- (ii) measuring either the expression level of one or more of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, or the level or activity of one or more of the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5;
- (iii) measuring either the expression level of one or more of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, or the level or activity of one or more of the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5 in a control cell not exposed to the test pharmacological agent;
- (iv) comparing the results determined in steps (ii) and (iii) wherein a difference in the expression level of one or more of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, or the level or activity of one or more of the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, indicates that the test pharmacological agent is suitable for use in the prevention and/or treatment of Alzheimer's disease.

In preferred embodiments, the one or more targets within the mTOR signalling pathway is/are selected from the group of rapamycin-sensitive genes consisting of calcium channel, voltage-dependent, L type, alpha 1D subunit (CACNA1 D), gamma-aminobutyric acid B receptor, 2 (GABBR2), homeobox D10 (HOXD10), Kruppel-like factor 2 (KLF2), rhodopsin (RHO) and GLI zinc finger family 2 (GLI2).

The pharmacological agents for testing in the screening methods provided herein may be selected from any class of agent as described in the context of the therapeutic methods of the present invention. The methods may involve screening one or more pharmacological agents simultaneously, for example in a multiplex format. Agents for use in the screening methods may be provided in any suitable format, including compound libraries.

The "difference" in gene expression and/or protein activity to be detected using the screening method described herein may be established according to the sensitivity requirements of those using the method to identify pharmacological agents suitable for the prevention and/or treatment of AD.

In certain embodiments, the difference may be measured as a decrease in the expression of one or more of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5 as compared with control cells not exposed to the pharmacological agent, wherein said decrease indicates that the test pharmacological agent is suitable for use in the prevention and/or treatment of Alzheimer's disease.

Any difference or decrease in gene expression may be measured by assessing the level of transcriptional product or mRNA produced from any of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5. Alternatively or in addition, any difference or decrease may be measured by assessing the levels of protein produced from any of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5.

Suitable methods for the detection/quantitation of transcriptional products which may be used in accordance with

13

the present methods are well known in the art, and include, but are not limited to hybridisation techniques, such as Northern blotting or microarray technologies, and amplification-based techniques such as RT-PCR or nucleic-acid sequence-based amplification (NASBA).

Suitable techniques for assessing protein levels are known in the art and include, but are not limited to, flow cytometry, immunoblot analysis, ELISA, Elispot and Fluorospot assays. In certain embodiments, these assays may be used in conjunction with commercially-available antibodies that bind to the protein of interest, in order to determine protein levels. Standard assays are also available for measuring the activity of certain proteins, for example standard enzyme activity assays, such as kinase assays.

Diagnostic Methods

In a further aspect, the current invention provides a method to assist with diagnosis of Alzheimer's disease in a live human subject.

In the context of the present invention, the term "diagnosis of Alzheimer's disease" is used very broadly and should be taken to mean diagnosis of an individual having disease at any one of the three phases of the disease defined above i.e. the preclinical stage, the pre-dementia stage or the dementia stage. In one embodiment, the method of the invention is used to diagnose or assist with diagnosis of Alzheimer's disease in its preclinical stage in an individual with no symptoms of disease, for example no signs of cognitive impairment. In other embodiments, the same basic methodology may be used to screen subjects who are "symptomatic" to varying degrees. For example, the method of the invention may be applied to individuals classified according to standard criteria, for example the Mayo Clinic diagnostic criteria (Winblad et al., (2004) *J. Intern. Med.* 256: 240-246), as having mild cognitive impairment (MCI). Not all patients classified as having MCI will have the type of underlying neurodegeneration associated with Alzheimer's disease. Thus, the present method may be used to distinguish or assist with distinguishing between individuals with MCI that have underlying Alzheimer's disease and therefore are likely to go on to develop Alzheimer's disease-associated dementia, and those that have MCI attributable to a different cause or condition. In a further embodiment of the invention, the method may be used to diagnose or assist with diagnosis of Alzheimer's disease in a human subject exhibiting one or more symptoms consistent with Alzheimer's disease.

The diagnostic methods of the present invention may also be used in conjunction with existing diagnostic criteria, for example the NINCDS/ADRDA criteria, in order to verify or substantiate an Alzheimer's disease diagnosis in a human subject who already meets the existing criteria for a positive diagnosis. In this embodiment, the present methods may provide an adjunct to alternative diagnostic tests, wherein the present methods are independent of neuropsychological symptoms. This may allow for a more reliable diagnosis of clinical Alzheimer's disease, particularly since not all patients presenting with dementia symptoms will have Alzheimer's disease as the underlying cause.

The present methods are used in particular, to assist with diagnosis of Alzheimer's disease in a live human subject. A definitive diagnosis of Alzheimer's disease is generally considered by those in the field to be impossible in a live subject, and can only be made post-mortem following pathological examination of brain tissue from the patient. Thus, although present methods may seek to "diagnose" Alzheimer's disease in live subjects, such a diagnosis is typically based on an assessment of the likelihood that any given individual has the disease. In this regard, individuals may be

14

classified as "possible Alzheimer's disease" or "probable Alzheimer's disease" based on the results of current diagnostic tests.

The present methods may therefore be used to "assist with diagnosis" meaning that they are used to assess the likelihood that an individual has Alzheimer's disease at any one of the three phases of the disease described above. In preferred embodiments, the present method may be used to assist with diagnosis of early-stage Alzheimer's disease in asymptomatic patients or patients exhibiting mild cognitive impairment.

The methods of the invention may also be used in combination or together with other methods or tests used for Alzheimer's disease diagnosis, for example in order to improve the specificity and/or sensitivity of these methods or tests. In specific embodiments, the present methods may be carried out in combination with a test designed to monitor one or more biomarkers of Alzheimer's disease in a particular individual, and the combined result may be used to assess the likelihood that the individual has Alzheimer's disease. In alternative embodiments, the present method may be used to independently substantiate the results of other diagnostic tests.

The present method is intended to provide a means to diagnose and/or assist with diagnosis of Alzheimer's disease in multiple settings. In one embodiment, the present method may be used to diagnose individuals with Alzheimer's disease so as to identify patients suitable for the assessment of new Alzheimer's disease treatments, for example the identification of suitable subjects for clinical trials. New treatments or therapies designed to be preventive and/or curative may only have the best chance of success in patients with asymptomatic or early-stage disease. The present method may therefore be used to diagnose or assist with diagnosis of pre-clinical Alzheimer's disease in asymptomatic individuals or to diagnose or assist with diagnosis of individuals with MCI that have underlying Alzheimer's disease pathology, for the purposes of assessing new treatments specifically in these patients. As improved treatments for Alzheimer's disease become available, the present methods may also be used to diagnose or assist with diagnosis of individuals so as to identify patients who will benefit from treatments that may have the ability to prevent cognitive decline.

The present invention also provides methods of assessing the risk of Alzheimer's disease progression in a human subject. In this context, "Alzheimer's disease progression" should be taken to mean the progressive neurodegeneration associated with this disease and/or the progressive decline in cognitive function that accompanies the underlying neuropathology. Such methods may be applied to individuals suspected of having any one of the three phases of Alzheimer's disease defined above, or individuals considered at risk of developing this disease.

In preferred embodiments of the invention, the methods provide means by which to assess or predict cognitive decline in human subjects by identifying individuals with early-stage Alzheimer's disease who will go on to develop Alzheimer's disease-associated dementia. In certain embodiments, the individual or human subject for testing will be asymptomatic for Alzheimer's disease. In alternative embodiments, the individual or human subject for testing will exhibit mild cognitive impairment or will exhibit one or more symptoms consistent with Alzheimer's disease.

In the diagnostic methods and the methods of assessing the risk of disease progression described above, the method comprises as a first step measuring either the expression

15

level of one or more of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5 and/or the activity of one or more of the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5. Gene expression may be analysed by assessing levels of mRNA produced following gene transcription or by assessing levels of the protein produced following translation of the mRNA. The detection of mRNA and protein levels may be carried out by methods known to those skilled in the art. Protein activity may also be analysed using suitable assays known to those skilled in the art.

In certain embodiments of the invention, protein activity may be measured directly. For example, the activity of a kinase enzyme may be measured using an assay that detects phosphorylation of the enzyme's direct substrate. Protein activity may also be measured indirectly by measuring alterations and/or changes in the level and/or activity of metabolites linked to the activity of the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5.

As a second step, the methods require a comparison between the gene expression levels and/or protein activity measured in the first step and the gene expression levels and/or protein activity defined as reference or control values. Such reference or control values may be determined from measurements made using age-matched healthy subjects, preferably wherein such subjects exhibit no signs of cognitive impairment. If the method is carried out with the intention of assessing the risk of Alzheimer's disease progression, the reference or control values may consist of values determined from measurements made using the same human subject at an earlier point in time, for example 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or 11 months earlier, or 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 etc years earlier. A comparison between measurements determined for the same human subject at different points in time may assist in determining whether there has been a change in the level of expression of a gene and/or activity of a protein over time that is indicative of Alzheimer's disease progression.

The genes and/or proteins for use in conjunction with the diagnostic methods of the present invention are selected from the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5. In preferred embodiments, the one or more targets within the mTOR signalling pathway is/are selected from the group of rapamycin-sensitive genes consisting of calcium channel, voltage-dependent, L type, alpha 1D subunit (CACNA1D), gamma-aminobutyric acid B receptor, 2 (GABBR2), homeobox D10 (HOXD10), Kruppel-like factor 2 (KLF2), rhodopsin (RHO) and GLI zinc finger family 2 (GLI2).

The measurement of gene expression and/or protein activity may be made using any suitable sample taken from the subject. In a preferred embodiment, the sample is derived from the cerebrospinal fluid of a patient. In certain embodiments, the level or gene expression and/or protein activity may be determined using imaging techniques, preferably non-invasive imaging of the subject's brain or regions thereof. In certain embodiments, imaging techniques may be used to detect alterations and/or temporal changes in brain metabolites, such as choline or creatine, that are indicative of a change in protein activity. Imaging techniques that may be particularly useful in conjunction with the present methods include but are not limited to PET, SPECT, MR spectroscopy and functional MRI.

16

Methods of Assessing Pre-disposition to Alzheimer's Disease

In a further aspect, the current invention also provides methods for screening a human subject for pre-disposition to Alzheimer's disease, wherein said method comprises the steps of:

- (i) measuring either the expression level of one or more of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, and/or the activity of one or more of the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5;
- (ii) comparing the expression level and/or activity measured in (i) with reference/control values, wherein a difference in expression level and/or activity of the one or more rapamycin sensitive genes shown in Tables 2, 3, 4 and 5 is taken to mean the subject is pre-disposed to Alzheimer's disease.

In certain embodiments of the invention, the difference may be measured as an increase in the expression level of one or more of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5, and/or the activity of one or more of the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5 as compared with reference/control values and such increase is taken to mean the subject is pre-disposed to Alzheimer's disease. Such "pre-disposition to Alzheimer's disease" may be manifest as an increased lifetime risk of developing Alzheimer's disease as compared with the average lifetime risk associated with the general population, and/or as an earlier age of onset of Alzheimer's disease in affected individuals.

As described above in connection with the diagnostic methods aspect of the invention, the presently-claimed methods comprise as a first step measuring either the expression level of one or more of the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5 and/or the activity of one or more of the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5. Gene expression may be analysed by assessing levels of mRNA produced following gene transcription or by assessing levels of the protein produced following translation of the mRNA. The detection of mRNA and protein levels may be carried out by methods known to those skilled in the art. Protein activity may also be analysed using suitable assays known to those skilled in the art.

In certain embodiments of the invention, protein activity may be measured directly. For example, the activity of a kinase enzyme may be measured using an assay that detects phosphorylation of the enzyme's direct substrate. Protein activity may also be measured indirectly by measuring alterations and/or changes in the level and/or activity of metabolites linked to the activity of the proteins encoded by the rapamycin-sensitive genes shown in Tables 2, 3, 4 and 5.

As a second step, the methods require a comparison between the gene expression levels and/or protein activity measured in the first step and the gene expression levels and/or protein activity defined as reference or control values. Such reference or control values may be determined from measurements made using age-matched healthy subjects, preferably wherein such subjects exhibit no signs of cognitive impairment. Alternatively or in addition, such reference or control values may be determined from measurements made using subjects that are known not to have developed Alzheimer's disease during their lifetime.

The screening methods described herein will typically be used to assess the pre-disposition to Alzheimer's disease in individuals that are otherwise asymptomatic for this disease.

Methods of Assessing Pre-disposition to Alzheimer's Disease Based on Detection of Polymorphisms

In a further aspect, provided herein is a method of screening a human subject for pre-disposition to Alzheimer's disease, which method comprises genotyping the subject for a polymorphism in one or more of the rapamycin-sensitive genes shown in Table 1, wherein the presence of at least one variant allele associated with Alzheimer's disease is an indication that the subject is pre-disposed to Alzheimer's disease.

In this aspect of the invention, "a polymorphism" can be taken to mean one or more polymorphisms. Therefore, provided herein is a method of screening a human subject for pre-disposition to Alzheimer's disease, which method comprises genotyping the subject for one or more polymorphisms in one or more of the rapamycin-sensitive genes shown in Table 1, wherein the presence of at least one variant allele associated with Alzheimer's disease is an indication that the subject is pre-disposed to Alzheimer's disease.

In a still further aspect, provided herein is a method of screening a human subject for pre-disposition to Alzheimer's disease, which method comprises genotyping the subject for one or more polymorphisms in one or more genes which affect the expression of one or more of the rapamycin-sensitive genes shown in Table 1, wherein the presence of at least one variant allele associated with Alzheimer's disease is an indication that the subject is pre-disposed to Alzheimer's disease.

As used herein, the term "polymorphism" includes single nucleotide polymorphisms or SNPs, which are changes in which a single base in the DNA differs from the usual base at that position. Millions of SNPs have been catalogued throughout the human genome, and many of these have been linked to increased or decreased susceptibility or pre-disposition to certain diseases. SNPs found within the ApoE gene have already been linked to elevated risk of Alzheimer's disease.

Associations between polymorphisms or polymorphic variants and susceptibility to Alzheimer's disease can be identified or confirmed by carrying out genetic association studies, for example family-based or case-control association studies. Associations may also be determined by evaluating the relationship between deregulated gene expression seen in the brain of Alzheimer's disease patients and the underlying genotype.

In the present methods for screening for pre-disposition to Alzheimer's disease, a subject is genotyped for one or more polymorphisms or polymorphic variants in one or more of the rapamycin-sensitive genes shown in Table 1. In certain embodiments, the subject may be genotyped for two or more, three or more, four or more, five or more, six or more, seven or more, eight or more, nine or more, ten or more polymorphisms or polymorphic variants in one or more of the rapamycin-sensitive genes shown in Table 1. Wherein the methods involve genotyping for more than one polymorphism, the polymorphisms may be in the same rapamycin-sensitive gene or in different rapamycin-sensitive genes.

Alternatively, or in addition, the subject may be genotyped for one or more, two or more, three or more, four or more, five or more, six or more, seven or more, eight or more, nine or more, ten or more polymorphisms or polymorphic variants in one or more genes which affect the expression of one or more of the rapamycin-sensitive genes shown in Table 1. Wherein the methods involve genotyping for more than one polymorphism, the polymorphisms may be in the same gene or in different genes. Polymorphisms or

polymorphic variants in genes which affect the expression of rapamycin-sensitive genes may be located in genes encoding regulators, particularly upstream regulators, of expression of genes in the mTOR signalling pathway described herein.

In the context of the present invention, a polymorphism "in" a gene should be taken to mean a genetic variant present at any position within the full-length native gene. Polymorphisms may therefore be located in exons, introns or in regulatory regions located upstream or downstream of the coding segment.

In preferred embodiments, the method comprises genotyping a subject for one or more polymorphisms in one or more rapamycin-sensitive genes selected from LILRB2, FAM5C, CRP, CLU, FCGR2A, CD1E, FAM5C, LPL, SYK and CUX1. Alternatively, or in addition, the method may comprise genotyping a subject for one or more polymorphisms in one or more genes which affect the expression of one or more rapamycin-sensitive genes, wherein the "regulatory" genes are selected from POU2F1, ADRA1A, PRDM1 and LOXL2.

POU2F1 is a transcriptional regulator of the mTOR genes: A2M, CRP, CSF1R, CYP2C9, ESR1, GSTM3, IL2, IL6, PRKAA2, SPP1, TLR4 from Table 1. ADRA1A is a regulator of mTOR regulated genes: CDKN1B, EGR1, FGF7, FN1, IL6, JUN, LOX, NR4A1, NR4A2 from Table 1. LOXL2 is an upstream regulator of mTOR regulated genes: CDH1, FN1, MMP9 from Table 1. PRDM1 is the upstream regulator of mTOR regulated genes: ESR1, IGHG1, IL10, IL2, IL6, MYC, RELN, SCGN from Table 1.

In preferred embodiments, the screening methods involve genotyping a subject for one or more, two or more, three or more, four or more, five or more, six or more, seven or more, eight or more, nine or more, ten or more polymorphisms selected from the group of single nucleotide polymorphisms consisting of rs798893, rs725106, rs1341665, rs1359059, rs1532278, rs1801274, rs2036108, rs811925, rs883524, rs1065457, rs1148613, rs295, rs290258, rs365836 and rs569214, as characterised in Table 14. The presence of at least one variant allele associated with Alzheimer's disease is an indication that the subject is pre-disposed to Alzheimer's disease. The bases of the variant alleles associated with Alzheimer's disease for the SNPs described above are as follows: rs798893 (C), rs725106 (A), rs1341665 (A), rs1359059 (A), rs1532278 (C), rs1801274 (G), rs2036108 (T), rs811925 (G), rs883524 (C), rs1065457 (G), rs1148613 (C), rs295 (C), rs290258 (G), rs365836 (G) and rs569214 (T) (see Table 14).

The screening methods may also involve genotyping a subject for one or more, two or more, three or more, four or more, five or more, six or more, seven or more, eight or more, nine or more, ten or more polymorphisms selected from the group of polymorphisms consisting of polymorphisms, particularly SNPs, associated with or in linkage disequilibrium (LD) with the single nucleotide polymorphisms: rs798893, rs725106, rs1341665, rs1359059, rs1532278, rs1801274, rs2036108, rs811925, rs883524, rs1065457, rs1148613, rs295, rs290258, rs365836 and rs569214. Polymorphisms "associated" with the SNPs characterised in Table 14 include polymorphisms in close proximity to the identified SNPs. Polymorphisms in linkage disequilibrium with the characterised SNPs could be identified by one of skill in the art using standard association mapping techniques described in the art.

The screening methods of the present invention may be carried out in conjunction with other screening methods used to assess pre-disposition to Alzheimer's disease including use of screening methods based on measuring the

expression of the rapamycin-sensitive gene targets described elsewhere herein (see Tables 2-5). Other methods for assessing a subject's pre-disposition or risk of Alzheimer's disease may utilise other known risk factors, including in particular environmental risk factors such as plasma homocysteine levels.

In accordance with the invention, genotyping of polymorphic variants can be carried out using any suitable methodology known in the art and it is to be understood that the invention is in no way limited by the precise technique used to carry out the genotyping.

Known techniques which may be used for genotyping single nucleotide polymorphisms include ligation detection reaction (LDR; Day, D. J., Speiser, P. W., White, P. C. & Barany, F. *Genomics* 29, 152-62 (1995)), mass spectrometry, particularly matrix-assisted laser desorption/ionization time-of-flight mass spectrometry (MALDI-TOF-MS), single nucleotide primer extension and DNA chips or microarrays (see review by Schafer, A. J. and Hawkins, J. R. in *Nature Biotechnology*, Vol 16, pp33-39 (1998)). The use of DNA chips or microarrays may enable simultaneous genotyping at many different polymorphic loci in a single individual or the simultaneous genotyping of a single polymorphic locus in multiple individuals. SNPs may also be scored by DNA sequencing.

In addition to the above, SNPs are commonly scored using PCR-based techniques, such as PCR-SSP using allele-specific primers (described by Bunce M, et al., *Tissue Antigens*, 1995; 50: 23-31). This method generally involves performing DNA amplification reactions using genomic DNA as the template and two different primer pairs, the first primer pair comprising an allele-specific primer which under appropriate conditions is capable of hybridising selectively to the wild type allele and a non allele-specific primer which binds to a complementary sequence elsewhere within the gene in question, the second primer pair comprising an allele-specific primer which under appropriate conditions is capable of hybridising selectively to the variant allele and the same non allele-specific primer. Further suitable techniques for scoring SNPs include PCR ELISA and denaturing high performance liquid chromatography (DHPLC).

If the SNP results in the abolition or creation of a restriction site, genotyping can be carried out by performing PCR using non-allele specific primers spanning the polymorphic site and digesting the resultant PCR product using the appropriate restriction enzyme (also known as PCR-RFLP). Restriction fragment length polymorphisms, including those resulting from the presence of a single nucleotide polymorphism, may be scored by digesting genomic DNA with an appropriate enzyme then performing a Southern blot using a labelled probe corresponding to the polymorphic region (see *Molecular Cloning: A Laboratory Manual*, Sambrook, Fritsch and Maniatis, Cold Spring Harbor Laboratory, Cold Spring Harbor, N.Y.).

In the context of the present invention, "genotyping" of any given polymorphic variant may advantageously comprise screening for the presence or absence in the genome of the subject of both the normal or wild type allele and the variant or mutant allele associated with disease, or may comprise screening for the presence or absence of either individual allele, it generally being possible to draw conclusions about the genotype of an individual at a polymorphic locus having two alternative allelic forms just by screening for one or other of the specific alleles.

Alzheimer's disease is a complex and multi-factorial condition. In any given individual the development of AD is likely to be associated with accumulation of genetic varia-

tion within a single gene, or across multiple genes, and the accumulated variants may have an additive effect. In view of the foregoing, it is within the scope of the invention to perform genotyping of polymorphisms or polymorphic variants within multiple genes, wherein at least one of the genes is selected from the rapamycin-sensitive genes shown in Table 1. Such a "panel screen" of multiple genes may be used to simultaneously analyse multiple polymorphisms that serve as markers of susceptibility/pre-disposition to Alzheimer's disease in the same human subject. In a preferred embodiment, genotyping of multiple polymorphisms in a single patient sample may be carried out simultaneously, for example with the use of a microarray or "gene chip".

In certain embodiments of the invention, the screening for pre-disposition to Alzheimer's disease will involve genotyping a subject for multiple polymorphisms or polymorphic variants in one or more of the genes shown in Table 1 or multiple polymorphisms or polymorphic variants in one or more genes which affect the expression of one or more of the rapamycin-sensitive genes shown in Table 1, or a combination of both. In the context of the present invention, "multiple" should be taken to mean two or more, three or more, four or more, five or more, six or more etc. The presence of multiple variant alleles associated with Alzheimer's disease is an indication that the subject is pre-disposed to Alzheimer's disease.

In further preferred embodiments, the screening methods will involve genotyping a subject for a combination of single polynucleotide polymorphisms selected from the following:

- (i) rs1065457, rs798893 and rs2036108;
- (ii) rs1065457, rs1148613, rs290258, rs725106 and rs1341665;
- (iii) rs1065457, rs295, rs1359059, rs1532278, rs798893, rs365836, rs725106 and rs1341665;
- (iv) rs1148613, rs290258, rs725106, rs1341665 and rs2036108;
- (v) rs1065457, rs1148613, rs290258, rs725106, rs1341665 and rs2036108;
- (vi) rs1065457, rs1359059, rs725106 and rs2036108; or
- (vii) rs798893 and rs725106,

wherein the presence of a combination of variant alleles associated with Alzheimer's disease is an indication that the subject is predisposed to Alzheimer's disease. The variant alleles associated with Alzheimer's disease for each of the SNPs in the combinations described above are as follows: rs798893 (C), rs725106 (A), rs1341665 (A), rs1359059 (A), rs1532278 (C), rs1801274 (G), rs2036108 (T), rs811925 (G), rs883524 (C), rs1065457 (G), rs1148613 (C), rs295 (C), rs290258 (G), rs365836 (G) and rs569214 (T).

Genotyping is preferably carried out in vitro, and is most preferably performed on an isolated sample containing genomic DNA prepared from a suitable tissue sample obtained from the subject under test. Most commonly, genomic DNA is prepared from a sample of whole blood or brain tissue, according to standard procedures which are well known in the art. If genomic sequence data for the individual under test in the region containing the SNP is available, for example in a genomic sequence database as a result of a prior genomic sequencing exercise, then genotyping of the SNP may be accomplished by searching the available sequence data.

In the case of genetic variants which have a detectable effect on the mRNA transcripts transcribed from a given gene, for example variants which cause altered splicing or which affect transcript termination or which affect the level of mRNA expression, then as an alternative to detecting the presence of the variant at the genomic DNA level, the

presence of the variant may be inferred by evaluating the mRNA expression pattern using any suitable technique. Similarly, in the case of genetic variants which have a detectable effect on the protein products encoded by a gene, for example variants which cause a change in primary amino acid sequence, structure or properties of the encoded protein, the presence of the variant may be inferred by evaluating the sequence, structure or properties of the protein using any convenient technique.

The above-described screening methods may be used prognostically to identify individuals pre-disposed to Alzheimer's disease (AD) by virtue of their genetic make-up. The "pre-disposition to Alzheimer's disease" may be manifest as an increased risk of developing disease as compared to the general population, or as an earlier age of disease onset as compared to individuals who do not possess a variant allele associated with Alzheimer's disease.

In certain embodiments, the method may be used to screen asymptomatic individuals (i.e. individuals who do not exhibit significant symptoms of AD according to standard diagnostic criteria) in order to identify those "at risk" of developing AD, and/or those likely to exhibit an earlier age of onset of AD. The results of such screens may facilitate early intervention with therapeutic treatments, particularly prophylactic treatments aimed at preventing, reducing or delaying the clinical symptoms of Alzheimer's disease.

In further embodiments the screening methods may be used to screen patients who exhibit clinical symptoms of Alzheimer's disease, for example to assist in correct diagnosis of AD and/or to investigate the genetic basis of suspected or confirmed AD.

Diagnostic Methods Based on Detection of Polymorphisms

In a further aspect, the invention provides a method to assist with diagnosis of Alzheimer's disease in a live human subject, which method comprises genotyping the subject for a polymorphism in one or more of the rapamycin-sensitive genes shown in Table 1, or a polymorphism in one or more genes which affect the expression of one or more of the rapamycin-sensitive genes shown in Table 1, wherein the presence of at least one variant allele associated with Alzheimer's disease is indicative of Alzheimer's disease.

Embodiments of the invention described in the context of diagnostic methods of the invention based on measuring the expression level of one or more rapamycin-sensitive genes are equally applicable to this further aspect of the invention. In addition, embodiments of the invention described in the context of methods for assessing pre-disposition to Alzheimer's disease based on genotyping a subject for one or more polymorphisms are equally applicable to this further aspect of the invention.

Methods to assist with diagnosis of Alzheimer's disease in a live human subject have been described in International patent application no. WO02/073212, incorporated herein by reference. These methods comprise a step of screening non-neuronal cells from a human subject for the presence of a cell cycle regulatory defect at the G1/S transition. One of the ways in which this defect can be assessed is by measuring the responsiveness of the non-neuronal cells to a G1 inhibitor, for example rapamycin. Differential responsiveness to a G1 inhibitor in lymphocytes taken from a subject suspected of having Alzheimer's disease is indicative of disease.

The diagnostic test described in WO02/073212 was developed based on the discovery that Alzheimer's disease is associated with aberrant re-entry of neurons into the cell division cycle. This change is an early event in disease

pathogenesis preceding formation of both amyloid- β plaques and neurofibrillary tangles. Therefore, detection of these cell cycle changes may be used to assist with diagnosis of Alzheimer's disease at an early stage, even in asymptomatic individuals.

Previous studies have shown that it is not cell cycle re-entry per se that contributes to Alzheimer's disease but rather the inability of neurons from Alzheimer's disease patients to respond appropriately to this cell-cycle re-entry.

10 In particular, neurons from Alzheimer's disease patients are unable to initiate G1 arrest and subsequently undergo re-differentiation, as a result of a defect in the G1/S regulatory checkpoint. Furthermore, this regulatory defect at the G1/S transition occurs in cells other than neurons in individuals with Alzheimer's disease, for example lymphocytes.

15 It is therefore possible to assist with the diagnosis of Alzheimer's disease in the live human subject by measuring the differential responsiveness of lymphocytes taken from the subject to G1 inhibitors, such as rapamycin.

20 The present diagnostic methods are based on the genotyping of a subject to look for the presence of polymorphisms, particularly single nucleotide polymorphisms (SNPs) in rapamycin-sensitive genes or in genes which affect the expression of rapamycin-sensitive genes. Importantly, it has been shown that SNPs within rapamycin-sensitive genes or SNPs in genes which affect the expression of rapamycin-sensitive genes correlate with the differential response to rapamycin observed in lymphocytes collected from individual Alzheimer's disease patients. Therefore, the

25 present methods involve genotyping a subject for a polymorphism in one or more of the rapamycin-sensitive genes shown in Table 1, or a polymorphism in one or more genes which affect the expression of one or more of the rapamycin-sensitive genes shown in Table 1 as an independent means to assist with diagnosis of Alzheimer's disease. In certain embodiments, the methods may involve genotyping a subject for multiple polymorphisms or polymorphic variants in one or more of the genes shown in Table 1 or multiple polymorphisms or polymorphic variants in one or more genes which affect the expression of one or more of the rapamycin-sensitive genes shown in Table 1, or a combination of both. In a preferred embodiment, genotyping of multiple polymorphisms in a single patient sample may be carried out simultaneously, for example with the use of a 30 microarray or "gene chip".

35 In preferred embodiments, the method comprises genotyping a subject for one or more polymorphisms in one or more rapamycin-sensitive genes selected from LILRB2, FAM5C, CRP, CLU, FCGR2A, CD1E, FAM5C, LPL, SYK and CUX1. Alternatively, or in addition, the method may comprise genotyping a subject for one or more polymorphisms in one or more genes which affect the expression of one or more rapamycin-sensitive genes, wherein the "regulatory" genes are selected from POU2F1, ADRA1A, PRDM1 and LOXL2.

40 In preferred embodiments, the diagnostic methods involve genotyping a subject for one or more, two or more, three or more, four or more, five or more, six or more, seven or more, eight or more, nine or more, ten or more polymorphisms selected from the group of single nucleotide polymorphisms consisting of rs798893, rs725106, rs1341665, rs1359059, rs1532278, rs1801274, rs2036108, rs811925, rs883524, rs1065457, rs1148613, rs295, rs290258, rs365836 and rs569214, as characterised in Table 14. The 45 presence of at least one variant allele associated with Alzheimer's disease is an indication that the subject is pre-disposed to Alzheimer's disease. The variant alleles

associated with Alzheimer's disease for the SNPs described above are as follows: rs798893 (C), rs725106 (A), rs1341665 (A), rs1359059 (A), rs1532278 (C), rs1801274 (G), rs2036108 (T), rs811925 (G), rs883524 (C), rs1065457 (G), rs1148613 (C), rs295 (C), rs290258 (G), rs365836 (G) and rs569214 (T).

The screening methods may also involve genotyping a subject for one or more, two or more, three or more, four or more, five or more, six or more, seven or more, eight or more, nine or more, ten or more polymorphisms selected from the group of polymorphisms consisting of polymorphisms, particularly SNPs, associated with or in linkage disequilibrium (LD) with the single nucleotide polymorphisms: rs798893, rs725106, rs1341665, rs1359059, rs1532278, rs1801274, rs2036108, rs811925, rs883524, rs1065457, rs1148613, rs295, rs290258, rs365836 and rs569214. Polymorphisms "associated" with the SNPs in Table 14 include polymorphisms in close proximity to the characterised SNPs. Polymorphisms in linkage disequilibrium with the characterised SNPs could be identified by one of skill in the art using standard association mapping techniques described in the art.

In further preferred embodiments, the diagnostic methods will involve genotyping a subject for a combination of single polynucleotide polymorphisms selected from the following:

- (i) rs1065457, rs798893 and rs2036108;
- (ii) rs1065457, rs1148613, rs290258, rs725106 and rs1341665;
- (iii) rs1065457, rs295, rs1359059, rs1532278, rs798893, rs365836, rs725106 and rs1341665;
- (iv) rs1148613, rs290258, rs725106, rs1341665 and rs2036108;
- (v) rs1065457, rs1148613, rs290258, rs725106, rs1341665 and rs2036108;
- (vi) rs1065457, rs1359059, rs725106 and rs2036108; or
- (vii) rs798893 and rs725106,

wherein the presence of a combination of variant alleles associated with Alzheimer's disease is indicative of a positive Alzheimer's disease diagnosis.

As noted above, the diagnostic methods described herein may also be used in combination or together with other methods or tests used for Alzheimer's disease diagnosis, for example in order to improve the specificity and/or sensitivity of these methods or tests. In a preferred embodiment, the diagnostic method of the present invention involves a first step of genotyping a subject for a combination of polymorphisms consisting of pr1 and pr10 and a second step of determining plasma homocysteine levels in the same subject.

Arrays and Kits

The present invention also provides arrays and kits for detecting one or more, two or more, three or more, four or more, five or more, six or more, seven or more, eight or more, nine or more, ten or more genetic polymorphisms or polymorphic variants in a sample taken from a subject. The one or more polymorphisms to be detected by the arrays and kits provided herein are in one or more of the rapamycin-sensitive genes shown in Table 1, or in one or more genes which affect the expression of one or more of the rapamycin-sensitive genes shown in Table 1.

Embodiments of the invention already described above in relation to the screening methods and diagnostic methods of the invention relating to the use of polymorphisms are equally applicable to the arrays and kits provided.

The sample taken from the subject may be any sample suitable for genetic analysis including but not limited to blood, saliva, tears, urine, skin, hair or any other tissue containing nucleic acid.

The array or kit may take any suitable format for the detection of polymorphisms, and the reagents forming the array or included in the kit will be dependent on the format adopted by the user. In certain embodiments, the array may take the form of a microarray or "gene chip" wherein oligonucleotides capable of detecting the one or more polymorphisms of interest, if present within the sample, are immobilised on a solid substrate. In certain embodiments, the oligonucleotides are allele-specific oligonucleotides capable of detecting the one or more polymorphisms by hybridisation to the variant allele. The invention therefore provides an array comprising multiple allele-specific oligonucleotides capable of detecting at least two, at least three, at least four, at least five etc different polymorphisms as described elsewhere herein. The design of suitable allele-specific oligonucleotides or probes and the construction of arrays comprising allele-specific oligonucleotides for detecting one or more polymorphisms, particularly SNPs, in a sample could be carried out using standard techniques well known in the art.

Kits according to the present invention may include reagents suitable for carrying out allele-specific Q-PCR, in order to detect one or more polymorphisms. Allele-specific Q-PCR is a variation of the standard polymerase chain reaction, which can be used to identify SNPs in a sample containing nucleic acid. The reagents would include all standard PCR reagents (DNA polymerase, Tris-HCl, (NH₄)₂ SO₄, MgCl₂, Tween20, dATP, dCTP, dTTP, dGTP) and suitable primers with 3' ends encompassing the SNP. Kits may also include allele-specific restriction enzymes, which can be used to detect the presence of SNPs based on the digestion pattern produced when the restriction enzyme digests the nucleic acid sample, as described elsewhere herein.

Methods to Monitor mTOR Signalling

As discussed elsewhere herein, the polymorphisms to be detected in the context of the screening and diagnostic methods described above, are either in one or more of the rapamycin-sensitive genes shown in Table 1, or in one or more genes which affect the expression of one or more of the rapamycin-sensitive genes shown in Table 1. The inhibitor rapamycin is known to inhibit the serine/threonine kinase mTOR in human cells and thereby reduce signalling downstream of this protein. It follows therefore that genes identified as rapamycin-sensitive genes are linked to mTOR signalling in cells.

Therefore, in a further aspect, the present invention also provides a method by which to monitor mTOR signalling in a human cell, which method comprises detecting one or more polymorphisms in one or more of the rapamycin-sensitive genes shown in Table 1, or one or more polymorphisms in one or more genes which affect the expression of one or more of the rapamycin-sensitive genes shown in Table 1, wherein the presence of at least one variant allele associated with a differential response to rapamycin is indicative of the status of mTOR signalling in the cell.

The cytoplasmic kinase mTOR is stimulated or activated by a wide variety of upstream signals. These include signals generated or triggered as a result of nutrient sensing, hypoxia, and/or the activity of growth factors and their cognate receptors. Activation of mTOR upregulates its kinase activity and thereby increases mTOR-mediated phosphorylation of downstream protein targets within the cell. In

most cases, the direct downstream protein targets of mTOR interact with a variety of further molecular targets, and in doing so, stimulate a wide variety of cellular responses, such as increased protein synthesis and the promotion of cell growth and proliferation. The chain of molecular events triggered downstream of mTOR-mediated phosphorylation of its direct protein targets is defined herein as the “mTOR signalling pathway”.

The methods of the present aspect of the invention allow for the monitoring of mTOR signalling. By “monitoring” is meant determination of the level of activity downstream of the mTOR kinase, for example the level of activity of proteins present within the downstream signalling pathways. Monitoring may be carried out in particular, to determine the functional integrity of the mTOR signalling pathway within a human cell.

In preferred embodiments, the one or more polymorphisms for detection are in one or more of the rapamycin-sensitive genes selected from LILRB2, FAM5C, CRP, CLU, FCGR2A, CD1E, FAM5C, LPL, SYK and CUX1 and/or in one or more of the genes which affect the expression of one or more rapamycin-sensitive genes, selected from POU2F1, ADRA1A, PRDM1 and LOXL2.

In preferred embodiments, the methods involve detecting one or more, two or more, three or more, four or more, five or more, six or more, seven or more, eight or more, nine or more, ten or more polymorphisms selected from the group of single nucleotide polymorphisms consisting of rs798893, rs725106, rs1341665, rs1359059, rs1532278, rs1801274, rs2036108, rs811925, rs883524, rs1065457, rs1148613, rs295, rs290258, rs365836 and rs569214, as characterised in Table 14. The methods may also involve detecting one or more, two or more, three or more, four or more, five or more, six or more, seven or more, eight or more, nine or more, ten or more polymorphisms selected from the group of polymorphisms consisting of polymorphisms, particularly SNPs, associated with or in linkage disequilibrium (LD) with the single nucleotide polymorphisms: rs798893, rs725106, rs1341665, rs1359059, rs1532278, rs1801274, rs2036108, rs811925, rs883524, rs1065457, rs1148613, rs295, rs290258, rs365836 and rs569214.

As described elsewhere herein, cells from subjects with Alzheimer’s disease typically exhibit a differential response to G1/S inhibitors, including rapamycin, as a result of a defect in the G1/S cell cycle transition. This differential response is reported in for example, WO02/073212, incorporated herein by reference. The SNPs or variant alleles characterised herein are associated with a differential response to rapamycin as seen in lymphocytes collected from individuals with Alzheimer’s disease. As noted above, rapamycin responsiveness is indicative of the status of mTOR signalling in the cell wherein “status” should be

taken to mean the functional integrity of signalling through the mTOR signalling pathway. Therefore, the presence of at least one variant allele associated with a differential response to rapamycin may be used to determine the status of mTOR signalling in a cell. In certain embodiments, the presence of at least one variant allele associated with a differential response to rapamycin may be used to determine that the functional integrity of the mTOR signalling pathway is compromised in a particular cell.

Wherein the one or more polymorphisms is/are selected from the group consisting of rs798893, rs725106, rs1341665, rs1359059, rs1532278, rs1801274, rs2036108, rs811925, rs883524, rs1065457, rs1148613, rs295, rs290258, rs365836 and rs569214, the bases of the variant alleles associated with a differential response to rapamycin are as follows: rs798893 (C), rs725106 (A), rs1341665 (A), rs1359059 (A), rs1532278 (C), rs1801274 (G), rs2036108 (T), rs811925 (G), rs883524 (C), rs1065457 (G), rs1148613 (C), rs295 (C), rs290258 (G), rs365836 (G) and rs569214 (T).

The methods of the present invention may be used to monitor mTOR signalling in any type of human cell. For example, the human cell may be a cell pre-treated with a compound such as a pharmacological inhibitor. In a preferred embodiment of the invention, the human cell is a lymphocyte.

Furthermore, in preferred embodiments of the invention, the human cell may be taken from an individual or human subject suspected of having a particular condition or disease, or considered to be at risk of developing a particular disease, most preferably Alzheimer’s disease. Wherein the human subject is suspected of having or developing Alzheimer’s disease, the cell may be taken from a subject that is asymptomatic for Alzheimer’s disease, or a subject who exhibits mild cognitive impairment or a subject exhibiting one or more symptoms consistent with Alzheimer’s disease.

The purpose of monitoring mTOR signalling in a cell taken from an individual or subject suspected of having a particular disease or considered at risk of a particular disease, may be to assist with diagnosis of disease in the subject or to assess the subject’s pre-disposition to disease. In the preferred embodiment of the present invention wherein the human cell is isolated from a human subject suspected of having Alzheimer’s disease, the method may be carried out in order to assist with the diagnosis of Alzheimer’s disease or to assess a subject’s pre-disposition to Alzheimer’s disease.

The present methods may also be used to assist with diagnosis of other diseases or conditions wherein dysregulation of signalling through the mTOR pathway is an underlying cause or consequence, for example cancer, type II diabetes, dementia following brain injury or stroke.

TABLE 1

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
A2M	alpha-2-macroglobulin	Extracellular Space	transporter
AADACL2	arylacetamide deacetylase-like 2	unknown	other
AASDH	aminoacidate-semialdehyde dehydrogenase	unknown	enzyme
ABCA8	ATP-binding cassette, sub-family A (ABC1), member 8	Plasma Membrane	transporter
ABCB5	ATP-binding cassette, sub-family B (MDR/TAP), member 5	Plasma Membrane	transporter
ABCD2	ATP-binding cassette, sub-family D (ALD), member 2	Cytoplasm	transporter
ABHD2	abhydrolase domain containing 2	unknown	enzyme
ABI3BP	ABI family, member 3 (NESH) binding protein	Extracellular Space	other
ABLIM2	actin binding LIM protein family, member 2	Cytoplasm	other

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
ABRA	actin-binding Rho activating protein	Cytoplasm	transcription regulator
ABTB1	ankyrin repeat and BTB (POZ) domain containing 1	Cytoplasm	translation regulator
ACOX2	acyl-CoA oxidase 2, branched chain	Cytoplasm	enzyme
ACCP	acid phosphatase, prostate	Extracellular Space	phosphatase
ACSL6	acyl-CoA synthetase long-chain family member 6	Cytoplasm	enzyme
ACSS1	acyl-CoA synthetase short-chain family member 1	Cytoplasm	enzyme
ACTRT1	actin-related protein T1	Cytoplasm	other
ACVR2B	activin A receptor, type IIB	Plasma Membrane	kinase
ADAMTS13	ADAM metallopeptidase with thrombospondin type 1 motif, 13	Extracellular Space	peptidase
ADAMTS15	ADAM metallopeptidase with thrombospondin type 1 motif, 15	Extracellular Space	peptidase
ADAMTS16	ADAM metallopeptidase with thrombospondin type 1 motif, 16	Extracellular Space	other
ADAMTS2	ADAM metallopeptidase with thrombospondin type 1 motif, 2	Extracellular Space	peptidase
ADAMTS20	ADAM metallopeptidase with thrombospondin type 1 motif, 20	Extracellular Space	peptidase
ADAMTS3	ADAM metallopeptidase with thrombospondin type 1 motif, 3	Extracellular Space	peptidase
ADAMTS9	ADAM metallopeptidase with thrombospondin type 1 motif, 9	Extracellular Space	peptidase
ADAMTSL3	ADAMTS-like 3	unknown	other
ADAMTSL4	ADAMTS-like 4	Extracellular Space	other
ADAMTSL5	ADAMTS-like 5	Extracellular Space	other
ADH6 (includes EG: 130)	alcohol dehydrogenase 6 (class V)	Cytoplasm	enzyme
ADIPOQ	adiponectin, C1Q and collagen domain containing	Extracellular Space	other
ADSSL1	adenylosuccinate synthase like 1	Cytoplasm	enzyme
AGT	angiotensinogen (serpin peptidase inhibitor, clade A, member 8)	Extracellular Space	growth factor
AGTR1	angiotensin II receptor, type 1	Plasma Membrane	G-protein coupled receptor
AHNAK	AHNAK nucleoprotein	Nucleus	other
AHNAK2	AHNAK nucleoprotein 2	unknown	other
AKR1D1	aldo-keto reductase family 1, member D1 (delta 4-3-ketosteroid-5-beta-reductase)	Cytoplasm	enzyme
ALDH1A3	aldehyde dehydrogenase 1 family, member A3	Cytoplasm	enzyme
AMY1A (includes others)	amylase, alpha 1A (salivary)	Extracellular Space	enzyme
ANGPT2	angiopoietin 2	Extracellular Space	growth factor
ANGPTL2	angiopoietin-like 2	Extracellular Space	other
ANGPTL5	angiopoietin-like 5	Extracellular Space	other
ANK1	ankyrin 1, erythrocytic	Plasma Membrane	other
ANKRD12	ankyrin repeat domain 12	Nucleus	other
ANKRD36B (includes others)	ankyrin repeat domain 36B	Nucleus	transcription regulator
ANKRD36B (includes others)	ankyrin repeat domain 36B	Nucleus	transcription regulator
ANKRD42	ankyrin repeat domain 42	Nucleus	transcription regulator
ANKRD45	ankyrin repeat domain 45	Nucleus	transcription regulator
ANKRD50	ankyrin repeat domain 50	unknown	other
ANKRD6	ankyrin repeat domain 6	Nucleus	transcription regulator
ANKS1B	ankyrin repeat and sterile alpha motif domain containing 1B	Nucleus	other
ANO3	anoctamin 3	unknown	other
ANXA10	annexin A10	Cytoplasm	other
ANXA2R	annexin A2 receptor	Plasma Membrane	other
AP1S1	adaptor-related protein complex 1, sigma 1 subunit	Cytoplasm	transporter
APBB1IP	amyloid beta (A4) precursor protein-binding, family B, member 1 interacting protein	Cytoplasm	other
APOB	apolipoprotein B (including Ag(x) antigen)	Extracellular Space	transporter
APOBEC3G	apolipoprotein B mRNA editing enzyme, catalytic polypeptide-like 3G	Nucleus	enzyme
APOLD1	apolipoprotein L domain containing 1	unknown	other
AQP12A/AQP12B	aquaporin 12B	Cytoplasm	transporter
AQP4	aquaporin 4	Plasma Membrane	transporter
AQP9	aquaporin 9	Plasma Membrane	transporter
AR	androgen receptor	Nucleus	ligand-dependent nuclear receptor

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
ARHGAP28	Rho GTPase activating protein 28	Cytoplasm	other
ARHGEF4	Rho guanine nucleotide exchange factor (GEF) 4	Cytoplasm	other
ARHGEF6	Rac/Cdc42 guanine nucleotide exchange factor (GEF) 6	Cytoplasm	other
ARL14	ADP-ribosylation factor-like 14	unknown	other
ARL17B/LOC100294341	ADP-ribosylation factor-like 17B	unknown	other
ARMC2	armadillo repeat containing 2	unknown	other
ARSE	arylsulfatase E (chondrodysplasia punctata 1)	Cytoplasm	enzyme
AS3MT	arsenic (+3 oxidation state) methyltransferase	Cytoplasm	enzyme
ASB11	ankyrin repeat and SOCS box containing 11	Nucleus	transcription regulator
ASPM	asp (abnormal spindle) homolog, microcephaly associated (<i>Drosophila</i>)	Nucleus	other
ASXL3	additional sex combs like 3 (<i>Drosophila</i>)	unknown	other
ATAD3A/ATAD3B	ATPase family, AAA domain containing 3A	Nucleus	other
ATF7IP	activating transcription factor 7 interacting protein	Nucleus	transcription regulator
ATP13A4	ATPase type 13A4	unknown	regulator
ATP6V0D2	ATPase, H ⁺ transporting, lysosomal 38 kDa, V0 subunit d2	Cytoplasm	transporter
ATP8B3	ATPase, aminophospholipid transporter, class I, type 8B, member 3	Cytoplasm	transporter
ATRNL1	attractin-like 1	unknown	other
AUTS2	autism susceptibility candidate 2	unknown	other
B2M	beta-2-microglobulin	Plasma Membrane	transmembrane receptor
B3GALT4	UDP-Gal:betaGlcNAc beta 1,3-galactosyltransferase, polypeptide 4	Cytoplasm	enzyme
B4GALT6	UDP-Gal:betaGlcNAc beta 1,4-galactosyltransferase, polypeptide 6	Cytoplasm	enzyme
BAIAP2	BAI1-associated protein 2	Plasma Membrane	kinase
BAIAP2L2	BAI1-associated protein 2-like 2	Cytoplasm	other
BARX2	BARX homeobox 2	Nucleus	transcription regulator
BCCIP	BRCA2 and CDKN1A interacting protein	Nucleus	other
BCL2	B-cell CLL/lymphoma 2	Cytoplasm	transporter
BEGAIN	brain-enriched guanylate kinase-associated homolog (rat)	Nucleus	other
BEND2	BEN domain containing 2	unknown	other
BEND6	BEN domain containing 6	unknown	other
BEST3	bestrophin 3	Nucleus	ion channel
BMP7	bone morphogenetic protein 7	Extracellular Space	growth factor
BMX	BMX non-receptor tyrosine kinase	Cytoplasm	kinase
BNC1	basonuclin 1	Nucleus	transcription regulator
BPESC1	blepharophimosis, epicanthus inversus and ptosis, candidate 1 (non-protein coding)	unknown	other
BPI	bactericidal/permeability-increasing protein	Plasma Membrane	transporter
BPIFB1	BPI fold containing family B, member 1	Extracellular Space	other
BRIP1	BRCA1 interacting protein C-terminal helicase 1	Nucleus	enzyme
BSN	bassoon (presynaptic cytomatrix protein)	Plasma Membrane	other
BSND	Bartter syndrome, infantile, with sensorineural deafness (Barttin)	Plasma Membrane	ion channel
BSPRY	B-box and SPRY domain containing	Cytoplasm	other
BTNL9	butyrophilin-like 9	unknown	other
BVES	blood vessel epicardial substance	Plasma Membrane	other
C10orf10	chromosome 10 open reading frame 10	Cytoplasm	other
C10orf107	chromosome 10 open reading frame 107	unknown	other
C10orf111	chromosome 10 open reading frame 111	unknown	other
C11orf67	chromosome 11 open reading frame 67	unknown	other
C11orf87	chromosome 11 open reading frame 87	unknown	other
C11orf88	chromosome 11 open reading frame 88	unknown	other
C12orf42	chromosome 12 open reading frame 42	unknown	other
C15orf43	chromosome 15 open reading frame 43	unknown	other
C15orf48	chromosome 15 open reading frame 48	Nucleus	other
C17orf78	chromosome 17 open reading frame 78	unknown	other
C17orf99	chromosome 17 open reading frame 99	unknown	other
C18orf26	chromosome 18 open reading frame 26	unknown	other
C1orf110	chromosome 1 open reading frame 110	unknown	other
C1orf127	chromosome 1 open reading frame 127	unknown	other
C1orf173	chromosome 1 open reading frame 173	unknown	other
C1orf226	chromosome 1 open reading frame 226	unknown	other
C1orf87	chromosome 1 open reading frame 87	unknown	other
C1QTNF6	C1q and tumor necrosis factor related protein 6	Extracellular Space	other
C20orf132	chromosome 20 open reading frame 132	unknown	other
C20orf85	chromosome 20 open reading frame 85	unknown	other

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
C2orf16	chromosome 2 open reading frame 16	unknown	other
C3orf36	chromosome 3 open reading frame 36	unknown	other
C3orf70	chromosome 3 open reading frame 70	unknown	other
C4orf19	chromosome 4 open reading frame 19	unknown	other
C4orf22	chromosome 4 open reading frame 22	unknown	other
C4orf26	chromosome 4 open reading frame 26	unknown	other
C4orf36	chromosome 4 open reading frame 36	unknown	other
C6orf223	chromosome 6 open reading frame 223	unknown	other
C7orf41	chromosome 7 open reading frame 41	unknown	other
C8orf42	chromosome 8 open reading frame 42	unknown	other
CA12	carbonic anhydrase XII	Plasma Membrane	enzyme
CA6	carbonic anhydrase VI	Extracellular Space	enzyme
CACNA1D	calcium channel, voltage-dependent, L type, alpha 1D subunit	Plasma Membrane	ion channel
CADPS	Ca++-dependent secretion activator	Plasma Membrane	other
CALD1	caldesmon 1	Cytoplasm	other
CARD14	caspase recruitment domain family, member 14	Cytoplasm	other
CATSPER2	cation channel, sperm associated 2	Plasma Membrane	ion channel
CATSPERD	catper channel auxiliary subunit delta	unknown	other
CAV2	caveolin 2	Plasma Membrane	other
CBX7	chromobox homolog 7	Nucleus	other
CC2D2A	coiled-coil and C2 domain containing 2A	unknown	other
CCDC141	coiled-coil domain containing 141	unknown	other
CCDC28A	coiled-coil domain containing 28A	unknown	other
CCDC34	coiled-coil domain containing 34	unknown	other
CCDC40	coiled-coil domain containing 40	unknown	other
CCDC85A	coiled-coil domain containing 85A	unknown	other
CCL1	chemokine (C-C motif) ligand 1	Extracellular Space	cytokine
CCL11	chemokine (C-C motif) ligand 11	Extracellular Space	cytokine
CCL2	chemokine (C-C motif) ligand 2	Extracellular Space	cytokine
CCL26	chemokine (C-C motif) ligand 26	Extracellular Space	cytokine
CCL8	chemokine (C-C motif) ligand 8	Extracellular Space	cytokine
CCNB2	cyclin B2	Cytoplasm	other
CCNG2	cyclin G2	Nucleus	other
CCR1	chemokine (C-C motif) receptor 1	Plasma Membrane	G-protein coupled receptor
CCR2	chemokine (C-C motif) receptor 2	Plasma Membrane	G-protein coupled receptor
CD177	CD177 molecule	Cytoplasm	other
CD1A	CD1a molecule	Plasma Membrane	other
CD1B	CD1b molecule	Plasma Membrane	other
CD1E	CD1e molecule	Cytoplasm	other
CD44 (includes EG: 100330801)	CD44 molecule (Indian blood group)	Plasma Membrane	enzyme
CD69	CD69 molecule	Plasma Membrane	transmembrane receptor
CD96	CD96 molecule	Plasma Membrane	other
CDC14B	CDC14 cell division cycle 14 homolog B (<i>S. cerevisiae</i>)	Nucleus	phosphatase
CDCP1	CUB domain containing protein 1	Plasma Membrane	other
CDCP2	CUB domain containing protein 2	unknown	transporter
CDH1	cadherin 1, type 1, E-cadherin (epithelial)	Plasma Membrane	other
CDH13	cadherin 13, H-cadherin (heart)	Plasma Membrane	other
CDH26	cadherin 26	Plasma Membrane	other
CDH7	cadherin 7, type 2	Plasma Membrane	other
CDHR1	cadherin-related family member 1	Plasma Membrane	other
CDKN1B	cyclin-dependent kinase inhibitor 1B (p27, Kip1)	Nucleus	kinase
CDKN1C	cyclin-dependent kinase inhibitor 1C (p57, Kip2)	Nucleus	other
CDKN2C	cyclin-dependent kinase inhibitor 2C (p18, inhibits CDK4)	Nucleus	transcription regulator
CDKN2D	cyclin-dependent kinase inhibitor 2D (p19, inhibits CDK4)	Nucleus	transcription regulator
CDON	Cdon homolog (mouse)	Plasma Membrane	other
CEACAM1 (includes others)	carcinoembryonic antigen-related cell adhesion molecule 1 (biliary glycoprotein)	Plasma Membrane	transmembrane receptor
CELF3	CUGBP, Elav-like family member 3	Nucleus	transcription regulator
CELF4	CUGBP, Elav-like family member 4	Nucleus	translation regulator
CELF6	CUGBP, Elav-like family member 6	unknown	other
CEP68	centrosomal protein 68 kDa	Cytoplasm	other
CFHRS	complement factor H-related 5	Extracellular Space	other
CFTR	cystic fibrosis transmembrane conductance regulator (ATP-binding cassette sub-family C, member 7)	Plasma Membrane	ion channel

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
CGA	glycoprotein hormones, alpha polypeptide	Extracellular Space	other
CGNL1	cingulin-like 1	Plasma Membrane	other
CHD2	chromodomain helicase DNA binding protein 2	Nucleus	enzyme
CHP2	calcineurin B homologous protein 2	Cytoplasm	other
CHRDL2	chordin-like 2	Extracellular Space	other
CHRNA9	cholinergic receptor, nicotinic, alpha 9 (neuronal)	Plasma Membrane	transmembrane receptor
CKM	creatine kinase, muscle	Cytoplasm	kinase
CLC	Charcot-Leyden crystal protein	Cytoplasm	enzyme
CLCA2	chloride channel accessory 2	Plasma Membrane	ion channel
CLEC7A	C-type lectin domain family 7, member A	Plasma Membrane	transmembrane receptor
CLTB	clathrin, light chain B	Plasma Membrane	other
CLVS1	clavesin 1	Cytoplasm	other
CNRIP1	cannabinoid receptor interacting protein 1	unknown	other
CNTN3	contactin 3 (plasmacytoma associated)	Plasma Membrane	other
COBL	cordon-bleu homolog (mouse)	unknown	other
COL11A1	collagen, type XI, alpha 1	Extracellular Space	other
COL13A1	collagen, type XIII, alpha 1	Plasma Membrane	other
COL1A2	collagen, type I, alpha 2	Extracellular Space	other
COL6A3	collagen, type VI, alpha 3	Extracellular Space	other
COL6A6	collagen, type VI, alpha 6	Extracellular Space	other
COL8A2	collagen, type VIII, alpha 2	Extracellular Space	other
COMM6	COMM domain containing 6	unknown	other
CORIN	corin, serine peptidase	Plasma Membrane	peptidase
CORO2A	coronin, actin binding protein, 2A	Cytoplasm	other
CPB2	carboxypeptidase B2 (plasma)	Extracellular Space	peptidase
CPE (includes EG: 12876)	carboxypeptidase E	Plasma Membrane	peptidase
CPLX2	complexin 2	Cytoplasm	other
CPXM2	carboxypeptidase X (M14 family), member 2	Extracellular Space	peptidase
CRB1	crumbs homolog 1 (<i>Drosophila</i>)	Plasma Membrane	other
CREB3L4	cAMP responsive element binding protein 3-like 4	Nucleus	transcription regulator
CREBRF	CREB3 regulatory factor	unknown	other
CRIM1	cysteine rich transmembrane BMP regulator 1 (chordin-like)	Extracellular Space	kinase
CROT	carnitine O-octanoyltransferase	Cytoplasm	enzyme
CRP	C-reactive protein, pentraxin-related	Extracellular Space	other
CRTAC1	cartilage acidic protein 1	Extracellular Space	other
CRYBG3	beta-gamma crystallin domain containing 3	unknown	other
CRYGB	crystallin, gamma B	Nucleus	other
CRYGD	crystallin, gamma D	Cytoplasm	other
CSDC2	cold shock domain containing C2, RNA binding	Cytoplasm	other
CSF1R	colony stimulating factor 1 receptor	Plasma Membrane	kinase
CSN2	casein beta	Extracellular Space	kinase
CTAG1B (includes others)	cancer/testis antigen 1B	Cytoplasm	other
CTDSP1	CTD (carboxy-terminal domain, RNA polymerase II, polypeptide A) small phosphatase 1	Nucleus	phosphatase
CTNNA3	catenin (cadherin-associated protein), alpha 3	Plasma Membrane	other
CTSF	cathepsin F	Cytoplasm	peptidase
CXorf51A/CXorf51B	chromosome X open reading frame 51A	unknown	other
CYP2C9	cytochrome P450, family 2, subfamily C, polypeptide 9	Cytoplasm	enzyme
CYP3A5	cytochrome P450, family 3, subfamily A, polypeptide 5	Cytoplasm	enzyme
CYP4F11	cytochrome P450, family 4, subfamily F, polypeptide 11	Cytoplasm	enzyme
CYP4F2	cytochrome P450, family 4, subfamily F, polypeptide 2	Cytoplasm	enzyme
CYP4F3	cytochrome P450, family 4, subfamily F, polypeptide 3	Cytoplasm	enzyme
CYP4V2	cytochrome P450, family 4, subfamily V, polypeptide 2	Cytoplasm	enzyme
CYP4X1	cytochrome P450, family 4, subfamily X, polypeptide 1	Cytoplasm	enzyme
CYP4Z1	cytochrome P450, family 4, subfamily Z, polypeptide 1	Cytoplasm	enzyme
CYR61	cysteine-rich, angiogenic inducer, 61	Extracellular Space	other
CYSLTR2	cysteinyl leukotriene receptor 2	Plasma Membrane	G-protein coupled receptor
DAOA	D-amino acid oxidase activator	Cytoplasm	other
DAPL1	death associated protein-like 1	unknown	other
DCAF12L1	DDB1 and CUL4 associated factor 12-like 1	unknown	other
DCC	deleted in colorectal carcinoma	Plasma Membrane	transmembrane receptor

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
DCD	dermcidin	Extracellular Space	other
DCLK1	doublecortin-like kinase 1	Plasma Membrane	kinase
DCN	decorin	Extracellular Space	other
DDI1 (includes EG: 367012)	DNA-damage inducible 1 homolog 1 (<i>S. cerevisiae</i>)	unknown	other
DDX17	DEAD (Asp-Glu-Ala-Asp) box helicase 17	Nucleus	enzyme
DEFA4	defensin, alpha 4, cortistatin	Extracellular Space	other
DEFB119	defensin, beta 119	Extracellular Space	other
DHRS12	dehydrogenase/reductase (SDR family) member 12	Nucleus	other
DHRS3	dehydrogenase/reductase (SDR family) member 3	Cytoplasm	enzyme
DKFZP586K1520	DKFZP586K1520 protein	unknown	other
DLEU7	deleted in lymphocytic leukemia, 7	unknown	other
DLG2	discs, large homolog 2 (<i>Drosophila</i>)	Plasma Membrane	kinase
DLGAP4	discs, large (<i>Drosophila</i>) homolog-associated protein 4	Plasma Membrane	other
DLX2	distal-less homeobox 2	Nucleus	transcription regulator
DMRTB1	DMRT-like family B with proline-rich C-terminal, 1	Nucleus	transcription regulator
DMRTC1/DMRTC1B	DMRT-like family C1B	unknown	other
DMRTC2	DMRT-like family C2	Nucleus	transcription regulator
DNAH1	dynein, axonemal, heavy chain 1	unknown	other
DNAH6	dynein, axonemal, heavy chain 6	unknown	other
DNAJB7	DnaJ (Hsp40) homolog, subfamily B, member 7	unknown	other
DPY19L1P1	dpy-19-like 1 pseudogene 1 (<i>C. elegans</i>)	unknown	other
DRP2	dystrophin related protein 2	Plasma Membrane	other
DSEL	dermatan sulfate epimerase-like	unknown	enzyme
DST	dystonin	Plasma Membrane	other
DTD1	D-tyrosyl-tRNA deacylase 1 homolog (<i>S. cerevisiae</i>)	Cytoplasm	enzyme
DUSP13	dual specificity phosphatase 13	Cytoplasm	phosphatase
DUSP21	dual specificity phosphatase 21	Cytoplasm	phosphatase
DUSP27	dual specificity phosphatase 27 (putative)	unknown	phosphatase
DYNC2LI1	dynein, cytoplasmic 2, light intermediate chain 1	Cytoplasm	other
DYNLRB1	dynein, light chain, roadblock-type 1	Cytoplasm	other
DZIP1L	DAZ interacting protein 1-like	unknown	other
DZIP3	DAZ interacting protein 3, zinc finger	Cytoplasm	enzyme
EBF2	early B-cell factor 2	Nucleus	other
EBF3	early B-cell factor 3	Nucleus	other
ECHDC2	enoyl CoA hydratase domain containing 2	unknown	other
ECM2 (includes EG: 1842)	extracellular matrix protein 2, female organ and adipocyte specific	Extracellular Space	other
ECT2L	epithelial cell transforming sequence 2 oncogene-like	unknown	other
EDDM3A	epididymal protein 3A	Extracellular Space	other
EDDM3B	epididymal protein 3B	Extracellular Space	other
EEP1	endonuclease/exonuclease/phosphatase family domain containing 1	unknown	other
EFCAB3	EF-hand calcium binding domain 3	unknown	other
EGF (includes EG: 13645)	epidermal growth factor	Extracellular Space	growth factor
EGLN3	egl nine homolog 3 (<i>C. elegans</i>)	Cytoplasm	enzyme
EGR1	early growth response 1	Nucleus	transcription regulator
ELAVL3	ELAV (embryonic lethal, abnormal vision, <i>Drosophila</i>)-like 3 (Hu antigen C)	Nucleus	other
ELAVL4	ELAV (embryonic lethal, abnormal vision, <i>Drosophila</i>)-like 4 (Hu antigen D)	Cytoplasm	other
ELOVL7	ELOVL fatty acid elongase 7	Cytoplasm	enzyme
EMCN	endomucin	Extracellular Space	other
EMX2OS	EMX2 opposite strand/antisense RNA (non-protein coding)	unknown	other
ENPEP	glutamyl aminopeptidase (aminopeptidase A)	Plasma Membrane	peptidase
ENPP6	ectonucleotide pyrophosphatase/phosphodiesterase 6	Cytoplasm	enzyme
ENTPD8	ectonucleoside triphosphate diphosphohydrolase 8	unknown	enzyme
EPB41L4B	erythrocyte membrane protein band 4.1 like 4B	unknown	transporter
EPHA5	EPH receptor A5	Plasma Membrane	kinase
EPO	erythropoietin	Extracellular Space	cytokine
ERBB3 (includes EG: 13867)	v-erb-b2 erythroblastic leukemia viral oncogene homolog 3 (avian)	Plasma Membrane	kinase
ERBB4	v-erb-a erythroblastic leukemia viral oncogene homolog 4 (avian)	Plasma Membrane	kinase
ESR1	estrogen receptor 1	Nucleus	ligand-dependent nuclear receptor
ESYT3	extended synaptotagmin-like protein 3	unknown	other
EYA1	eyes absent homolog 1 (<i>Drosophila</i>)	Nucleus	phosphatase

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
F11	coagulation factor XI	Extracellular Space	peptidase
F2	coagulation factor II (thrombin)	Extracellular Space	peptidase
F2RL2	coagulation factor II (thrombin) receptor-like 2	Plasma Membrane	G-protein coupled receptor
F9	coagulation factor IX	Extracellular Space	peptidase
FAM100B	family with sequence similarity 100, member B	unknown	other
FAM135B	family with sequence similarity 135, member B	unknown	enzyme
FAM13C	family with sequence similarity 13, member C	unknown	other
FAM149B1	family with sequence similarity 149, member B1	unknown	other
FAM153A/FAM153B	family with sequence similarity 153, member A	unknown	other
FAM155A	family with sequence similarity 155, member A	unknown	other
FAM162B	family with sequence similarity 162, member B	unknown	other
FAM171B	family with sequence similarity 171, member B	unknown	other
FAM172A	family with sequence similarity 172, member A	Cytoplasm	transcription regulator
FAM177A1	family with sequence similarity 177, member A1	unknown	other
FAM181B	family with sequence similarity 181, member B	unknown	other
FAM19A1	family with sequence similarity 19 (chemokine (C-C motif)-like), member A1	unknown	other
FAM211A	family with sequence similarity 211, member A	unknown	other
FAM24A	family with sequence similarity 24, member A	unknown	other
FAM26D	family with sequence similarity 26, member D	unknown	other
FAM27E3 (includes others)	family with sequence similarity 27, member E3	unknown	other
FAM43B	family with sequence similarity 43, member B	unknown	other
FAM5C	family with sequence similarity 5, member C	Cytoplasm	other
FAM64A	family with sequence similarity 64, member A	Nucleus	other
FAM71D	family with sequence similarity 71, member D	unknown	other
FAM74A3	family with sequence similarity 74, member A3	unknown	other
FAM84A	family with sequence similarity 84, member A	unknown	other
FAM92B	family with sequence similarity 92, member B	unknown	other
FAT3	FAT tumor suppressor homolog 3 (<i>Drosophila</i>)	unknown	other
FAXC	failed axon connections homolog (<i>Drosophila</i>)	unknown	other
FBLN1	fibrulin 1	Extracellular Space	other
FBN2 (includes EG: 14119)	fibrillin 2	Extracellular Space	other
FBP2	fructose-1,6-bisphosphatase 2	Cytoplasm	phosphatase
FBXL16	F-box and leucine-rich repeat protein 16	unknown	other
FCGBP	Fc fragment of IgG binding protein	Extracellular Space	other
FGF (includes EG: 110135)	fibrinogen beta chain	Extracellular Space	other
FGF11	fibroblast growth factor 11	Extracellular Space	growth factor
FGF18	fibroblast growth factor 18	Extracellular Space	growth factor
FGF2	fibroblast growth factor 2 (basic)	Extracellular Space	growth factor
FGF23	fibroblast growth factor 23	Extracellular Space	growth factor
FGF7	fibroblast growth factor 7	Extracellular Space	growth factor
FGFR1	fibroblast growth factor receptor 1	Plasma Membrane	kinase
FGG	fibrinogen gamma chain	Extracellular Space	other
FGGY	FGGY carbohydrate kinase domain containing	unknown	other
FGR	Gardner-Rasheed feline sarcoma viral (v-fgr) oncogene homolog	Nucleus	kinase
FIGN	fidgetin	Nucleus	other
FILIP1	filamin A interacting protein 1	Cytoplasm	other
FJX1	four jointed box 1 (<i>Drosophila</i>)	Extracellular Space	other
FLJ35946	uncharacterized protein FLJ35946	unknown	other
FLJ36000	uncharacterized FLJ36000	unknown	other
FLJ37035	uncharacterized LOC399821	unknown	other
FLJ37644	uncharacterized LOC400618	unknown	other
FLJ42875	uncharacterized LOC440556	unknown	other
FMN2	formin 2	unknown	other
FMO3	flavin containing monooxygenase 3	Cytoplasm	enzyme
FN1	fibronectin 1	Extracellular Space	enzyme
FN3K	fructosamine 3 kinase	Cytoplasm	kinase
FNBPI	formin binding protein 1	Nucleus	enzyme
FNDC5	fibronectin type III domain containing 5	unknown	other
FRAT2	frequently rearranged in advanced T-cell lymphomas 2	Cytoplasm	other
FREM3	FRAS1 related extracellular matrix 3	Extracellular Space	other
FRMD4A	FERM domain containing 4A	Plasma Membrane	other
FRMD6	FERM domain containing 6	Cytoplasm	other
FRMD7	FERM domain containing 7	Plasma Membrane	other
FSTL5	follistatin-like 5	Extracellular Space	other
FUT9	fucosyltransferase 9 (alpha (1,3) fucosyltransferase)	Cytoplasm	enzyme
GOS2	G0/G1switch 2	Cytoplasm	other

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
GAB1	GRB2-associated binding protein 1	Cytoplasm	other
GABBR2	gamma-aminobutyric acid (GABA) B receptor, 2	Plasma Membrane	G-protein coupled receptor
GABRA1	gamma-aminobutyric acid (GABA) A receptor, alpha 1	Plasma Membrane	ion channel
GABRA5	gamma-aminobutyric acid (GABA) A receptor, alpha 5	Plasma Membrane	ion channel
GABRG1	gamma-aminobutyric acid (GABA) A receptor, gamma 1	Plasma Membrane	ion channel
GABRR2	gamma-aminobutyric acid (GABA) A receptor, rho 2	Plasma Membrane	ion channel
GAGE1 (includes others)	G antigen 1	unknown	other
GALNT10	UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 10 (GalNAc-T10)	Cytoplasm	enzyme
GALNT5	UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 5 (GalNAc-T5)	Cytoplasm	enzyme
GBP3	guanylate binding protein 3	Cytoplasm	enzyme
GCM2	glial cells missing homolog 2 (<i>Drosophila</i>)	Nucleus	transcription regulator
GDA	guanine deaminase	Cytoplasm	enzyme
GFAP	glial fibrillary acidic protein	Cytoplasm	other
GFRA1	GDNF family receptor alpha 1	Plasma Membrane	transmembrane receptor
GFRA2	GDNF family receptor alpha 2	Plasma Membrane	transmembrane receptor
GHRLOS	ghrelin opposite strand/antisense RNA (non-protein coding)	unknown	other
GIGYF1	GRB10 interacting GYF protein 1	unknown	other
GIPR	gastric inhibitory polypeptide receptor	Plasma Membrane	G-protein coupled receptor
GLI2	GLI family zinc finger 2	Nucleus	transcription regulator
GLP1R	glucagon-like peptide 1 receptor	Plasma Membrane	G-protein coupled receptor
GLRA1	glycine receptor, alpha 1	Plasma Membrane	ion channel
GNAL	guanine nucleotide binding protein (G protein), alpha activating activity polypeptide, olfactory type	Cytoplasm	enzyme
GNG8	guanine nucleotide binding protein (G protein), gamma 8	Plasma Membrane	enzyme
GPAM	glycerol-3-phosphate acyltransferase, mitochondrial	Cytoplasm	enzyme
GPC3	glycan 3	Plasma Membrane	other
GPR110	G protein-coupled receptor 110	Plasma Membrane	G-protein coupled receptor
GPR116	G protein-coupled receptor 116	Plasma Membrane	G-protein coupled receptor
GPR176	G protein-coupled receptor 176	Plasma Membrane	G-protein coupled receptor
GPR34	G protein-coupled receptor 34	Plasma Membrane	G-protein coupled receptor
GPR37	G protein-coupled receptor 37 (endothelin receptor type B-like)	Plasma Membrane	G-protein coupled receptor
GPR4	G protein-coupled receptor 4	Plasma Membrane	G-protein coupled receptor
GPX6	glutathione peroxidase 6 (olfactory)	Extracellular Space	enzyme
GPX8	glutathione peroxidase 8 (putative)	unknown	enzyme
GRIA1	glutamate receptor, ionotropic, AMPA 1	Plasma Membrane	ion channel
GRIA2	glutamate receptor, ionotropic, AMPA 2	Plasma Membrane	ion channel
GRIA3	glutamate receptor, ionotropic, AMPA 3	Plasma Membrane	ion channel
GRIK2	glutamate receptor, ionotropic, kainate 2	Plasma Membrane	ion channel
GRIK3	glutamate receptor, ionotropic, kainate 3	Plasma Membrane	ion channel
GRM1	glutamate receptor, metabotropic 1	Plasma Membrane	G-protein coupled receptor
GRPR	gastrin-releasing peptide receptor	Plasma Membrane	G-protein coupled receptor
GSG1L	GSG1-like	unknown	other
GSN	gelsolin	Extracellular Space	other
GSTA1	glutathione S-transferase alpha 1	Cytoplasm	enzyme

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
GSTA5	glutathione S-transferase alpha 5	Cytoplasm	enzyme
GSTM3	glutathione S-transferase mu 3 (brain)	Cytoplasm	enzyme
GUCY1A3	guanylate cyclase 1, soluble, alpha 3	Cytoplasm	enzyme
GUCY2F	guanylate cyclase 2F, retinal	Plasma Membrane	kinase
GVINP1	GTPase, very large interferon inducible pseudogene 1	Cytoplasm	other
HABP2	hyaluronan binding protein 2	Extracellular Space	peptidase
HAND1	heart and neural crest derivatives expressed 1	Nucleus	transcription regulator
HAND2	heart and neural crest derivatives expressed 2	Nucleus	transcription regulator
HAPLN1	hyaluronan and proteoglycan link protein 1	Extracellular Space	other
HCAR3	hydroxycarboxylic acid receptor 3	Plasma Membrane	G-protein coupled receptor
HCK	hemopoietic cell kinase	Cytoplasm	kinase
HDAC5	histone deacetylase 5	Nucleus	transcription regulator
HDAC9	histone deacetylase 9	Nucleus	transcription regulator
HESX1	HESX homeobox 1	Nucleus	transcription regulator
HGF	hepatocyte growth factor (hepatopietin A; scatter factor)	Extracellular Space	growth factor
HHIP	hedgehog interacting protein	Plasma Membrane	other
HHIPL1	HHIP-like 1	unknown	other
HIST1H2BN	histone cluster 1, H2bn	Nucleus	other
HIST1H4A (includes others)	histone cluster 1, H4a	Nucleus	other
HIVEP2	human immunodeficiency virus type I enhancer binding protein 2	Nucleus	transcription regulator
HMGCS2	3-hydroxy-3-methylglutaryl-CoA synthase 2 (mitochondrial)	Cytoplasm	enzyme
HNF4G	hepatocyte nuclear factor 4, gamma	Nucleus	transcription regulator
HOXA2	homeobox A2	Nucleus	transcription regulator
HOXA9	homeobox A9	Nucleus	transcription regulator
HOXC8	homeobox C8	Nucleus	transcription regulator
HOXD10	homeobox D10	Nucleus	transcription regulator
HRASLS5	HRAS-like suppressor family, member 5	unknown	other
HSD17B13	hydroxysteroid (17-beta) dehydrogenase 13	Extracellular Space	enzyme
HTN3	histatin 3	Extracellular Space	other
HTR2C	5-hydroxytryptamine (serotonin) receptor 2C, G protein-coupled	Plasma Membrane	G-protein coupled receptor
HTR3C	5-hydroxytryptamine (serotonin) receptor 3C, ionotropic	Plasma Membrane	ion channel
HYDIN	HYDIN, axonemal central pair apparatus protein	unknown	other
IFFO1	intermediate filament family orphan 1	unknown	other
IFIT2	interferon-induced protein with tetratricopeptide repeats 2	Cytoplasm	other
IFNA16	interferon, alpha 16	Extracellular Space	cytokine
IGBP1	immunoglobulin (CD79A) binding protein 1	Cytoplasm	phosphatase
IGF2	insulin-like growth factor 2 (somatomedin A)	Extracellular Space	growth factor
IKZF4	IKAROS family zinc finger 4 (Eos)	Nucleus	transcription regulator
IL10	interleukin 10	Extracellular Space	cytokine
IL17B	interleukin 17B	Extracellular Space	cytokine
IL18 (includes EG: 16173)	interleukin 18 (interferon-gamma-inducing factor)	Extracellular Space	cytokine
IL1B	interleukin 1, beta	Extracellular Space	cytokine
IL1RAPL1	interleukin 1 receptor accessory protein-like 1	Plasma Membrane	transmembrane receptor
IL1RN	interleukin 1 receptor antagonist	Extracellular Space	cytokine
IL2	interleukin 2	Extracellular Space	cytokine
IL3	interleukin 3 (colony-stimulating factor, multiple)	Extracellular Space	other
IL31	interleukin 31	unknown	other
IL6	interleukin 6 (interferon, beta 2)	Extracellular Space	cytokine
IMPG1	interphotoreceptor matrix proteoglycan 1	Extracellular Space	other
INGX	inhibitor of growth family, X-linked, pseudogene	unknown	other
INPP5E	inositol polyphosphate-5-phosphatase, 72 kDa	Cytoplasm	phosphatase
INPP5K	inositol polyphosphate-5-phosphatase K	Cytoplasm	phosphatase
INSLS	insulin-like 5	Extracellular Space	other

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
IQCF1	IQ motif containing F1	unknown	other
IRS2	insulin receptor substrate 2	Cytoplasm	enzyme
IRX4	iroquois homeobox 4	Nucleus	transcription regulator
ISX	intestine-specific homeobox	unknown	other
ITGB3	integrin, beta 3 (platelet glycoprotein IIIa, antigen CD61)	Plasma Membrane	transmembrane receptor
ITGBL1	integrin, beta-like 1 (with EGF-like repeat domains)	unknown	other
JAK1 (includes EG: 16451)	Janus kinase 1	Cytoplasm	kinase
JAKMIP3	Janus kinase and microtubule interacting protein 3	unknown	other
JARID2	jumonji, AT rich interactive domain 2	Nucleus	transcription regulator
JUN	jun proto-oncogene	Nucleus	transcription regulator
KANK2	KN motif and ankyrin repeat domains 2	Nucleus	transcription regulator
KCNA3	potassium voltage-gated channel, shaker-related subfamily, member 3	Plasma Membrane	ion channel
KCNA4	potassium voltage-gated channel, shaker-related subfamily, member 4	Plasma Membrane	ion channel
KCNA7	potassium voltage-gated channel, shaker-related subfamily, member 7	Plasma Membrane	ion channel
KCNAB1	potassium voltage-gated channel, shaker-related subfamily, beta member 1	Plasma Membrane	ion channel
KCNB2	potassium voltage-gated channel, Shab-related subfamily, member 2	Plasma Membrane	ion channel
KCNC1	potassium voltage-gated channel, Shaw-related subfamily, member 1	Plasma Membrane	ion channel
KCNC2	potassium voltage-gated channel, Shaw-related subfamily, member 2	Plasma Membrane	ion channel
KCND3	potassium voltage-gated channel, Shal-related subfamily, member 3	Plasma Membrane	ion channel
KCNG4	potassium voltage-gated channel, subfamily G, member 4	Plasma Membrane	ion channel
KCNH7	potassium voltage-gated channel, subfamily H (eag-related), member 7	Plasma Membrane	ion channel
KCNIP2	Kv channel interacting protein 2	Cytoplasm	other
KCNJ5	potassium inwardly-rectifying channel, subfamily J, member 5	Plasma Membrane	ion channel
KCNK10	potassium channel, subfamily K, member 10	Plasma Membrane	ion channel
KCNK17	potassium channel, subfamily K, member 17	Plasma Membrane	ion channel
KCNQ1	potassium voltage-gated channel, KQT-like subfamily, member 1	Plasma Membrane	ion channel
KCNQ1DN	KCNQ1 downstream neighbor (non-protein coding)	unknown	other
KCP (includes EG: 296952)	kielin/chordin-like protein	Extracellular Space	other
KCTD19	potassium channel tetramerisation domain containing 19	unknown	other
KCTD4	potassium channel tetramerisation domain containing 4	unknown	ion channel
KIAA0355	KIAA0355	unknown	other
KIAA0825	KIAA0825	unknown	other
KIAA1045	KIAA1045	unknown	other
KIAA1109	KIAA1109	unknown	other
KIAA1239	KIAA1239	unknown	other
KIAA1407	KIAA1407	unknown	other
KIAA1462	KIAA1462	unknown	other
KIAA1522	KIAA1522	unknown	other
KIAA1683	KIAA1683	Cytoplasm	other
KIF6	kinesin family member 6	Nucleus	other
KIRREL3	kin of IRRE like 3 (<i>Drosophila</i>)	Extracellular Space	other
KL	klotho	Extracellular Space	enzyme
KLF12	Kruppel-like factor 12	Nucleus	transcription regulator
KLF2	Kruppel-like factor 2 (lung)	Nucleus	transcription regulator
KLHDC9	kelch domain containing 9	unknown	other
KLHL24	kelch-like 24 (<i>Drosophila</i>)	unknown	other
KLHL4	kelch-like 4 (<i>Drosophila</i>)	Cytoplasm	other
KLRB1	killer cell lectin-like receptor subfamily B, member 1	Plasma Membrane	transmembrane receptor
KRT2	keratin 2	Cytoplasm	other
KRT6B	keratin 6B	Cytoplasm	other
KRT72	keratin 72	unknown	other
KRT75	keratin 75	Cytoplasm	other
KRT82	keratin 82	Cytoplasm	other

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
KRTAP1-1	keratin associated protein 1-1	unknown	other
KRTAP1-3	keratin associated protein 1-3	unknown	other
KRTAP15-1	keratin associated protein 15-1	unknown	other
KRTAP4-7	keratin associated protein 4-7	unknown	other
KRTAP9-2	keratin associated protein 9-2	unknown	other
LAIR2	leukocyte-associated immunoglobulin-like receptor 2	Plasma Membrane	other
LAMA1	laminin, alpha 1	Extracellular Space	other
LAYN	layilin	Plasma Membrane	other
LCE1E	late cornified envelope 1E	unknown	other
LECT1	leukocyte cell derived chemotaxin 1	Extracellular Space	other
LEF1	lymphoid enhancer-binding factor 1	Nucleus	transcription regulator
LEFTY1	left-right determination factor 1	Extracellular Space	growth factor
LEMD1	LEM domain containing 1	unknown	other
LEP	leptin	Extracellular Space	growth factor
LGALS13	lectin, galactoside-binding, soluble, 13	unknown	enzyme
LGALS2	lectin, galactoside-binding, soluble, 2	Cytoplasm	other
LGR5	leucine-rich repeat containing G protein-coupled receptor 5	Plasma Membrane	G-protein coupled receptor
LIFR	leukemia inhibitory factor receptor alpha	Plasma Membrane	transmembrane receptor
LILRB2	leukocyte immunoglobulin-like receptor, subfamily B (with TM and ITIM domains), member 2	Plasma Membrane	other
LINC00317	long intergenic non-protein coding RNA 317	unknown	other
LINC00477	long intergenic non-protein coding RNA 477	unknown	other
LIPF	lipase, gastric	Extracellular Space	enzyme
LOC100128098	uncharacterized LOC100128098	unknown	other
LOC100128108	uncharacterized LOC100128108	unknown	other
LOC100129406	uncharacterized LOC100129406	unknown	other
LOC100129476	uncharacterized LOC100129476	unknown	other
LOC100129775	uncharacterized LOC100129775	unknown	other
LOC100130278	uncharacterized LOC100130278	unknown	other
LOC100130776	uncharacterized LOC100130776	unknown	other
LOC100130815	uncharacterized LOC100130815	unknown	other
LOC100131176	uncharacterized LOC100131176	unknown	other
LOC100132116	uncharacterized LOC100132116	unknown	other
LOC100132363	uncharacterized LOC100132363	unknown	other
LOC100170939	glucuronidase, beta pseudogene	unknown	other
LOC100190938	uncharacterized LOC100190938	unknown	other
LOC100190986	uncharacterized LOC100190986	unknown	other
LOC100288966/POTED	POTE ankyrin domain family, member D	Plasma Membrane	other
LOC120824/SPRYD5	SPRY domain containing 5	unknown	other
LOC283174	uncharacterized LOC283174	unknown	other
LOC283663	uncharacterized LOC283663	unknown	other
LOC283665	uncharacterized LOC283665	unknown	other
LOC284260	uncharacterized LOC284260	unknown	other
LOC284861	uncharacterized LOC284861	unknown	other
LOC286071	uncharacterized LOC286071	unknown	other
LOC286382	uncharacterized LOC286382	unknown	other
LOC339260	uncharacterized LOC339260	unknown	other
LOC389023	uncharacterized LOC389023	unknown	other
LOC389043	uncharacterized LOC389043	unknown	other
LOC390705	protein phosphatase 2, regulatory subunit B'', beta pseudogene	unknown	other
LOC400620	uncharacterized LOC400620	unknown	other
LOC400655	uncharacterized LOC400655	unknown	other
LOC401317	uncharacterized LOC401317	unknown	other
LOC441601	septin 7 pseudogene	unknown	other
LOC474358	uncharacterized BC042079 locus	unknown	other
LOC644192	uncharacterized LOC644192	unknown	other
LOC646471	uncharacterized LOC646471	unknown	other
LOC646627	phospholipase inhibitor	unknown	other
LOC647107	uncharacterized LOC647107	unknown	other
LOC647946	uncharacterized LOC647946	unknown	other
LOC728093/LOC729915	putative POM121-like protein 1	unknown	other
LOC728323	uncharacterized LOC728323	unknown	other
LOC729121	uncharacterized LOC729121	unknown	other
LOC729970	hCG2028352-like	unknown	other
LOX (includes EG: 16948)	lysyl oxidase	Extracellular Space	enzyme
LOXL3	lysyl oxidase-like 3	Extracellular Space	enzyme
LOXL4	lysyl oxidase-like 4	Extracellular Space	enzyme
LPIN2	lipin 2	Nucleus	phosphatase
LRCH2	leucine-rich repeats and calponin homology (CH) domain containing 2	unknown	other

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
LRP1 (includes EG: 16971)	low density lipoprotein receptor-related protein 1	Plasma Membrane	transmembrane receptor
LRP1B	low density lipoprotein receptor-related protein 1B	Plasma Membrane	transmembrane receptor
LRRC27	leucine rich repeat containing 27	unknown	other
LRRC37A3 (includes others)	leucine rich repeat containing 37, member A3	unknown	other
LRRC48	leucine rich repeat containing 48	Cytoplasm	other
LRRC71	leucine rich repeat containing 71	unknown	other
LRRC1	leucine rich repeat and coiled-coil domain containing 1	Nucleus	transporter
LTBP1	latent transforming growth factor beta binding protein 1	Extracellular Space	other
LUM	lumican	Extracellular Space	other
LYPD2	LY6/PLAUR domain containing 2	unknown	other
LYPD6	LY6/PLAUR domain containing 6	Extracellular Space	other
MACF1	microtubule-actin crosslinking factor 1	Cytoplasm	enzyme
MAEL	maelstrom homolog (<i>Drosophila</i>)	Cytoplasm	other
MAL	mal, T-cell differentiation protein	Plasma Membrane	transporter
MAPK4	mitogen-activated protein kinase 4	Cytoplasm	kinase
MAPT	microtubule-associated protein tau	Cytoplasm	other
MARK1	MAP/microtubule affinity-regulating kinase 1	Cytoplasm	kinase
MARVELD3	MARVEL domain containing 3	unknown	other
MAS1	MAS1 oncogene	Plasma Membrane	G-protein coupled receptor
MBD3L2 (includes others)	methyl-CpG binding domain protein 3-like 2	unknown	other
MBP	myelin basic protein	Extracellular Space	other
MCHR2	melanin-concentrating hormone receptor 2	Plasma Membrane	G-protein coupled receptor
MCTP1	multiple C2 domains, transmembrane 1	unknown	other
MECOM	MDS1 and EVI1 complex locus	Nucleus	transcription regulator
MEG3	maternally expressed 3 (non-protein coding)	unknown	other
METTL21A	methyltransferase like 21A	unknown	other
METTL7A	methyltransferase like 7A	unknown	other
MFAP5	microfibrillar associated protein 5	Extracellular Space	other
MGC24103	uncharacterized MGC24103	unknown	other
MGC39545	uncharacterized LOC403312	unknown	other
MGC70870	C-terminal binding protein 2 pseudogene	unknown	other
MGEAS	meningioma expressed antigen 5 (hyaluronidase)	Cytoplasm	enzyme
MIA2	melanoma inhibitory activity 2	Extracellular Space	other
MIER1	mesoderm induction early response 1 homolog (<i>Xenopus laevis</i>)	Nucleus	other
MIR7-3HG	MIR7-3 host gene (non-protein coding)	unknown	other
MIS18BP1	MIS18 binding protein 1	Nucleus	other
MLF1	myeloid leukemia factor 1	Nucleus	other
MLL	myeloid/lymphoid or mixed-lineage leukemia (trithorax homolog, <i>Drosophila</i>)	Nucleus	transcription regulator
MLLT4	myeloid/lymphoid or mixed-lineage leukemia (trithorax homolog, <i>Drosophila</i> ; translocated to, 4	Nucleus	other
MME	membrane metallo-endopeptidase	Plasma Membrane	peptidase
MMP12	matrix metallopeptidase 12 (macrophage elastase)	Extracellular Space	peptidase
MMP16	matrix metallopeptidase 16 (membrane-inserted)	Extracellular Space	peptidase
MMP2	matrix metallopeptidase 2 (gelatinase A, 72 kDa gelatinase, 72 kDa type IV collagenase)	Extracellular Space	peptidase
MMP8	matrix metallopeptidase 8 (neutrophil collagenase)	Extracellular Space	peptidase
MMP9	matrix metallopeptidase 9 (gelatinase B, 92 kDa gelatinase, 92 kDa type IV collagenase)	Extracellular Space	peptidase
MNT	MAX binding protein	Nucleus	transcription regulator
MORN5	MORN repeat containing 5	unknown	other
MOXD1	monooxygenase, DBH-like 1	Cytoplasm	enzyme
MPP4	membrane protein, palmitoylated 4 (MAGUK p55 subfamily member 4)	Cytoplasm	kinase
MPPED2	metallophosphoesterase domain containing 2	unknown	other
MRO	maestro	Nucleus	other
MSMB	microseminoprotein, beta-	Extracellular Space	other
MTHFR	methylenetetrahydrofolate reductase (NAD(P)H)	Cytoplasm	enzyme
MTL5	metallothionein-like 5, testis-specific (tesmin)	Cytoplasm	other
MTMR7	myotubularin related protein 7	Cytoplasm	phosphatase
MUC17	mucin 17, cell surface associated	Plasma Membrane	other
MXI1	MAX interactor 1	Nucleus	transcription regulator

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
MYCL1	v-myc myelocytomatosis viral oncogene homolog 1, lung carcinoma derived (avian)	Nucleus	transcription regulator
MYF6	myogenic factor 6 (herculin)	Nucleus	transcription regulator
MYO16	myosin XVI	Cytoplasm	other
MYO3B	myosin IIIB	unknown	kinase
MYOM1	myomesin 1, 185 kDa	Cytoplasm	other
MYOZ1	myozemin 1	Cytoplasm	other
MYPN	myopalladin	Cytoplasm	other
N4BP2L1	NEDD4 binding protein 2-like 1	unknown	other
NAG20	NAG20	unknown	other
NAV1	neuron navigator 1	Cytoplasm	enzyme
NAV2	neuron navigator 2	Nucleus	other
NBR1	neighbor of BRCA1 gene 1	Cytoplasm	other
NDRG2	NDRG family member 2	Cytoplasm	other
NECAB2	N-terminal EF-hand calcium binding protein 2	Cytoplasm	other
NEGR1	neuronal growth regulator 1	Extracellular Space	other
NEUROD4	neuronal differentiation 4	Nucleus	other
NEXN-AS1	NEXN antisense RNA 1 (non-protein coding)	unknown	other
NFIB	nuclear factor I/B	Nucleus	transcription regulator
NIPBL	Nipped-B homolog (<i>Drosophila</i>)	Nucleus	transcription regulator
NKX3-2	NK3 homeobox 2	Nucleus	transcription regulator
NLRP13	NLR family, pyrin domain containing 13	unknown	other
NMNAT2	nicotinamide nucleotide adenyllyltransferase 2	Cytoplasm	enzyme
NMU	neuromedin U	Extracellular Space	other
NOTCH2NL	notch 2 N-terminal like	unknown	other
NOX1	NADPH oxidase 1	Cytoplasm	ion channel
NPTX1	neuronal pentraxin I	Extracellular Space	other
NR2F2	nuclear receptor subfamily 2, group F, member 2	Nucleus	ligand-dependent nuclear receptor
NR4A1	nuclear receptor subfamily 4, group A, member 1	Nucleus	ligand-dependent nuclear receptor
NR4A2	nuclear receptor subfamily 4, group A, member 2	Nucleus	ligand-dependent nuclear receptor
NRG2	neuregulin 2	Extracellular Space	growth factor
NRIP2	nuclear receptor interacting protein 2	Nucleus	transcription regulator
NRXN3	neurexin 3	Plasma Membrane	transporter
NSUN7	NOP2/Sun domain family, member 7	unknown	other
NTN4	netrin 4	Extracellular Space	other
NTSR1	neurotensin receptor 1 (high affinity)	Plasma Membrane	G-protein coupled receptor
NUDT9P1	nudix (nucleoside diphosphate linked moiety X)-type motif 9 pseudogene 1	unknown	other
NUP210P1	nucleoporin 210 kDa pseudogene 1	unknown	other
NYAP1	neuronal tyrosine-phosphorylated phosphoinositide-3-kinase adaptor 1	unknown	other
OCA2 (includes EG: 18431)	oculocutaneous albinism II	Plasma Membrane	transporter
ODF1	outer dense fiber of sperm tails 1	Cytoplasm	other
OGN	osteoglycin	Extracellular Space	growth factor
OIT3	oncoprotein induced transcript 3	Nucleus	other
OLFML2A	olfactomedin-like 2A	Extracellular Space	other
OLIG2	oligodendrocyte lineage transcription factor 2	Nucleus	transcription regulator
OPRM1	opioid receptor, mu 1	Plasma Membrane	G-protein coupled receptor
OR10J1	olfactory receptor, family 10, subfamily J, member 1	Plasma Membrane	G-protein coupled receptor
OR10T2	olfactory receptor, family 10, subfamily T, member 2	Plasma Membrane	other
OR1E1	olfactory receptor, family 1, subfamily E, member 1	Plasma Membrane	G-protein coupled receptor

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
OR2C3	olfactory receptor, family 2, subfamily C, member 3	Plasma Membrane	other
OR2L13	olfactory receptor, family 2, subfamily L, member 13	Plasma Membrane	G-protein coupled receptor
OR2S2	olfactory receptor, family 2, subfamily S, member 2	Plasma Membrane	G-protein coupled receptor
OR2V2	olfactory receptor, family 2, subfamily V, member 2	Plasma Membrane	G-protein coupled receptor
OR4N4	olfactory receptor, family 4, subfamily N, member 4	Plasma Membrane	G-protein coupled receptor
OR51E1	olfactory receptor, family 51, subfamily E, member 1	Plasma Membrane	G-protein coupled receptor
OR51E2	olfactory receptor, family 51, subfamily E, member 2	Plasma Membrane	G-protein coupled receptor
OR51Q1	olfactory receptor, family 51, subfamily Q, member 1	Plasma Membrane	G-protein coupled receptor
OR52B2	olfactory receptor, family 52, subfamily B, member 2	Plasma Membrane	G-protein coupled receptor
OR5AK2	olfactory receptor, family 5, subfamily AK, member 2	Plasma Membrane	G-protein coupled receptor
OSBPL2	oxysterol binding protein-like 2	Cytoplasm	other
OSTalpha	organic solute transporter alpha	Plasma Membrane	transporter
OTX1	orthodenticle homeobox 1	Nucleus	transcription regulator
OVOL1	ovo-like 1(<i>Drosophila</i>)	Nucleus	transcription regulator
P2RY13	purinergic receptor P2Y, G-protein coupled, 13	Plasma Membrane	G-protein coupled receptor
P2RY14	purinergic receptor P2Y, G-protein coupled, 14	Plasma Membrane	G-protein coupled receptor
PABPC5	poly(A) binding protein, cytoplasmic 5	Cytoplasm	other
PAOX	polyamine oxidase (exo-N4-amino)	Cytoplasm	enzyme
PARVA	parvin, alpha	Cytoplasm	other
PASD1	PAS domain containing 1	Nucleus	other
PAX3	paired box 3	Nucleus	transcription regulator
PCDH11X/PCDH11Y	protocadherin 11 Y-linked	Plasma Membrane	other
PCDH18	protocadherin 18	Extracellular Space	other
PCDH7	protocadherin 7	Plasma Membrane	other
PCDHB10	protocadherin beta 10	Plasma Membrane	other
PCDHB5	protocadherin beta 5	Plasma Membrane	other
PCDHGA9	protocadherin gamma subfamily A, 9	unknown	other
PCDHGB8P	protocadherin gamma subfamily B, 8 pseudogene	unknown	other
PCMTD2	protein-L-isoaspartate (D-aspartate) O-methyltransferase domain containing 2	Cytoplasm	enzyme
PCNXL2	pecanex-like 2 (<i>Drosophila</i>)	unknown	other
PCSK2	proprotein convertase subtilisin/kexin type 2	Extracellular Space	peptidase
PDC	phosducin	Cytoplasm	other
PCCD4	programmed cell death 4 (neoplastic transformation inhibitor)	Nucleus	other
PDE1A	phosphodiesterase 1A, calmodulin-dependent	Cytoplasm	enzyme
PDE4C	phosphodiesterase 4C, cAMP-specific	Cytoplasm	enzyme
PDE4DIP	phosphodiesterase 4D interacting protein	Cytoplasm	enzyme
PDE6A	phosphodiesterase 6A, cGMP-specific, rod, alpha	Plasma Membrane	enzyme
PDE8B	phosphodiesterase 8B	Cytoplasm	enzyme
PDK4	pyruvate dehydrogenase kinase, isozyme 4	Cytoplasm	kinase
PDLIM3	PDLIM domain 3	Cytoplasm	other
PDZD9	PDZ domain containing 9	unknown	other
PDZRN4	PDZ domain containing ring finger 4	unknown	other
PES1	pescadillo ribosomal biogenesis factor 1	Nucleus	other
PEX5L	peroxisomal biogenesis factor 5-like	Cytoplasm	ion channel
PHACTR1	phosphatase and actin regulator 1	Cytoplasm	other
PHF12	PHD finger protein 12	Nucleus	transcription regulator
HLDA3	pleckstrin homology-like domain, family A, member 3	Plasma Membrane	other
HLDB2	pleckstrin homology-like domain, family B, member 2	Cytoplasm	other

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
PHYHD1	phytanoyl-CoA dioxygenase domain containing 1	unknown	other
PHYHIPL	phytanoyl-CoA 2-hydroxylase interacting protein-like	Cytoplasm	other
PIM1	pin-1 oncogene	Cytoplasm	kinase
PIP	prolactin-induced protein	Extracellular Space	other
PTPNM2	phosphatidylinositol transfer protein, membrane-associated 2	Cytoplasm	enzyme
PKD1L1	polycystic kidney disease 1 like 1	Extracellular Space	other
PKHD1	polycystic kidney and hepatic disease 1 (autosomal recessive)	Plasma Membrane	other
PKP1	plakophilin 1 (ectodermal dysplasia/skin fragility syndrome)	Plasma Membrane	other
PLA2R1	phospholipase A2 receptor 1, 180 kDa	Plasma Membrane	transmembrane receptor
PLAT	plasminogen activator, tissue	Extracellular Space	peptidase
PLB1 (includes EG: 151056)	phospholipase B1	Cytoplasm	enzyme
PLCD4	phospholipase C, delta 4	Cytoplasm	enzyme
PLCH1	phospholipase C, eta 1	Cytoplasm	enzyme
PLCZ1	phospholipase C, zeta 1	unknown	enzyme
PLD1	phospholipase D1, phosphatidylcholine-specific	Cytoplasm	enzyme
PLD3	phospholipase D family, member 3	Cytoplasm	enzyme
PLEKHA6	pleckstrin homology domain containing, family A member 6	unknown	other
PLEKHH2	pleckstrin homology domain containing, family H (with MyTH4 domain) member 2	Cytoplasm	other
PLGLB1/PLGLB2	plasminogen-like B2	Extracellular Space	peptidase
PLN	phospholamban	Cytoplasm	other
PLSCR2	phospholipid scramblase 2	unknown	other
PLSCR4	phospholipid scramblase 4	Plasma Membrane	enzyme
PM20D1	peptidase M20 domain containing 1	unknown	peptidase
PMCH	pro-melanin-concentrating hormone	Extracellular Space	other
PMCHL1	pro-melanin-concentrating hormone-like 1, pseudogene	Extracellular Space	other
PNLIP	pancreatic lipase	Extracellular Space	enzyme
PNPLA1	patatin-like phospholipase domain containing 1	unknown	enzyme
PNRC1	proline-rich nuclear receptor coactivator 1	Nucleus	other
POLK	polymerase (DNA directed) kappa	Nucleus	enzyme
POLR2M	polymerase (RNA) II (DNA directed) polypeptide M	Nucleus	other
PON3	paraoxonase 3	Extracellular Space	enzyme
POTEE/POTEF	POTE ankyrin domain family, member F	unknown	other
POU4F2	POU class 4 homeobox 2	Nucleus	transcription regulator
PPAPDC1A	phosphatidic acid phosphatase type 2 domain containing 1A	unknown	phosphatase
PPIC	peptidylprolyl isomerase C (cyclophilin C)	Cytoplasm	enzyme
PRICKLE2	prickle homolog 2 (<i>Drosophila</i>)	Nucleus	other
PRKAA2	protein kinase, AMP-activated, alpha 2 catalytic subunit	Cytoplasm	kinase
PRKG1	protein kinase, cGMP-dependent, type I	Cytoplasm	kinase
PRODH2	proline dehydrogenase (oxidase) 2	Cytoplasm	enzyme
PRR16	proline rich 16	unknown	other
PRSS23	protease, serine, 23	Extracellular Space	peptidase
PSORS1C1	psoriasis susceptibility 1 candidate 1	unknown	other
PTCH1	patched 1	Plasma Membrane	transmembrane receptor
PTGER3	prostaglandin E receptor 3 (subtype EP3)	Plasma Membrane	G-protein coupled receptor
PTGS2	prostaglandin-endoperoxide synthase 2 (prostaglandin G/H synthase and cyclooxygenase)	Cytoplasm	enzyme
PTPRC	protein tyrosine phosphatase, receptor type, C	Plasma Membrane	phosphatase
PTPRZ1	protein tyrosine phosphatase, receptor-type, Z	Plasma Membrane	phosphatase
PYCR1	pyrroline-5-carboxylate reductase 1	Cytoplasm	enzyme
PZP	pregnancy-zone protein	Extracellular Space	other
RAB37	RAB37, member RAS oncogene family	Cytoplasm	enzyme
RAB39A	RAB39A, member RAS oncogene family	Cytoplasm	enzyme
RAB3C (includes EG: 115827)	RAB3C, member RAS oncogene family	Cytoplasm	enzyme
RAET1E	retinoic acid early transcript 1E	Plasma Membrane	other
RAG1	recombination activating gene 1	Nucleus	enzyme
RAMP1	receptor (G protein-coupled) activity modifying protein 1	Plasma Membrane	transporter
RAVER2	ribonucleoprotein, PTB-binding 2	Nucleus	other
RBMY1A1 (includes others)	RNA binding motif protein, Y-linked, family 1, member A1	Nucleus	other

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
RBPMS2	RNA binding protein with multiple splicing 2	unknown	other
RERGL	RERG/RAS-like	unknown	other
REST	RE1-silencing transcription factor	Nucleus	transcription regulator
RET	ret proto-oncogene	Plasma Membrane	kinase
REXO1L1 (includes others)	REX1, RNA exonuclease 1 homolog (<i>S. cerevisiae</i>)-like 1	unknown	enzyme
RGNEF	190 kDa guanine nucleotide exchange factor	Cytoplasm	other
RHO	rhodopsin	Plasma Membrane	G-protein coupled receptor
RHOT1	ras homolog family member T1	Cytoplasm	enzyme
RIMBP3 (includes others)	RIMS binding protein 3	Nucleus	other
RIMS2	regulating synaptic membrane exocytosis 2	unknown	other
RIN2	Ras and Rab interactor 2	Cytoplasm	other
RTT2	Ras-like without CAAX 2	Plasma Membrane	enzyme
RM12	RM12, RecQ mediated genome instability 2, homolog (<i>S. cerevisiae</i>)	unknown	other
RND3	Rho family GTPase 3	Cytoplasm	enzyme
RNF125	ring finger protein 125, E3 ubiquitin protein ligase	unknown	other
RNF128	ring finger protein 128, E3 ubiquitin protein ligase	Cytoplasm	enzyme
RNF133	ring finger protein 133	Cytoplasm	other
RNF175	ring finger protein 175	unknown	other
RNF8	ring finger protein 8, E3 ubiquitin protein ligase	Nucleus	enzyme
RORB	RAR-related orphan receptor B	Nucleus	ligand-dependent nuclear receptor
RPL32P3	ribosomal protein L32 pseudogene 3	unknown	other
RPS6KB1	ribosomal protein S6 kinase, 70 kDa, polypeptide 1	Cytoplasm	kinase
RRAD	Ras-related associated with diabetes	Cytoplasm	enzyme
RUFY2	RUN and FYVE domain containing 2	Nucleus	other
RUNX1T1	runt-related transcription factor 1; translocated to, 1 (cyclin D-related)	Nucleus	transcription regulator
RUNX2	runt-related transcription factor 2	Nucleus	transcription regulator
SALL3	sal-like 3 (<i>Drosophila</i>)	Nucleus	other
SCARNA17	small Cajal body-specific RNA 17	unknown	other
SCGN	secretagogin, EF-hand calcium binding protein	Cytoplasm	other
SCN3B	sodium channel, voltage-gated, type III, beta subunit	Plasma Membrane	ion channel
SCN8A	sodium channel, voltage gated, type VIII, alpha subunit	Plasma Membrane	ion channel
SEMA4C	sema domain, immunoglobulin domain (Ig), transmembrane domain (TM) and short cytoplasmic domain, (semaphorin) 4C	Plasma Membrane	other
SEMA5A	sema domain, seven thrombospondin repeats (type 1 and type 1-like), transmembrane domain (TM) and short cytoplasmic domain, (semaphorin) 5A	Plasma Membrane	transmembrane receptor
SEMA6A	sema domain, transmembrane domain (TM), and cytoplasmic domain, (semaphorin) 6A	Plasma Membrane	other
SEMG2	semenogelin II	Extracellular Space	other
SERPINA10	serpin peptidase inhibitor, clade A (alpha-1 antiproteinase, antitrypsin), member 10	Extracellular Space	other
SERPINB3	serpin peptidase inhibitor, clade B (ovalbumin), member 3	Extracellular Space	other
SERPINB4	serpin peptidase inhibitor, clade B (ovalbumin), member 4	Cytoplasm	other
SERPIND1	serpin peptidase inhibitor, clade D (heparin cofactor), member 1	Extracellular Space	other
SERPINE1	serpin peptidase inhibitor, clade E (nexin, plasminogen activator inhibitor type 1), member 1	Extracellular Space	other
SERTAD4	SERTA domain containing 4	unknown	other
SGCD	sarcoglycan, delta (35 kDa dystrophin-associated glycoprotein)	Cytoplasm	other
SGCZ	sarcoglycan, zeta	Plasma Membrane	other
SGTA	small glutamine-rich tetratricopeptide repeat (TPR)-containing, alpha	Cytoplasm	other
SH3PXD2A	SH3 and PX domains 2A	Cytoplasm	other
SHANK3	SH3 and multiple ankyrin repeat domains 3	Cytoplasm	transcription regulator
SHROOM2	shroom family member 2	Plasma Membrane	ion channel
SHROOM4	shroom family member 4	Plasma Membrane	other
SIGLEC1	sialic acid binding Ig-like lectin 1, sialoadhesin	Plasma Membrane	other
SIM2	single-minded homolog 2 (<i>Drosophila</i>)	Nucleus	transcription regulator

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
SLC13A1	solute carrier family 13 (sodium/sulfate symporters), member 1	Plasma Membrane	transporter
SLC15A1	solute carrier family 15 (oligopeptide transporter), member 1	Plasma Membrane	transporter
SLC16A5	solute carrier family 16, member 5 (monocarboxylic acid transporter 6)	Plasma Membrane	transporter
SLC18A1	solute carrier family 18 (vesicular monoamine), member 1	Plasma Membrane	transporter
SLC18A3	solute carrier family 18 (vesicular acetylcholine), member 3	Plasma Membrane	transporter
SLC19A3	solute carrier family 19, member 3	Plasma Membrane	transporter
SLC22A18	solute carrier family 22, member 18	Plasma Membrane	transporter
SLC22A9	solute carrier family 22 (organic anion transporter), member 9	Plasma Membrane	transporter
SLC25A27	solute carrier family 25, member 27	Cytoplasm	transporter
SLC25A36	solute carrier family 25, member 36	Cytoplasm	transporter
SLC35F3	solute carrier family 35, member F3	unknown	other
SLC38A3	solute carrier family 38, member 3	Plasma Membrane	transporter
SLC46A2	solute carrier family 46, member 2	Plasma Membrane	transporter
SLC4A2	solute carrier family 4, anion exchanger, member 2 (erythrocyte membrane protein band 3-like 1)	Plasma Membrane	transporter
SLC6A1	solute carrier family 6 (neurotransmitter transporter, GABA), member 1	Plasma Membrane	transporter
SLC6A11	solute carrier family 6 (neurotransmitter transporter, GABA), member 11	Plasma Membrane	transporter
SLC6A15	solute carrier family 6 (neutral amino acid transporter), member 15	Plasma Membrane	transporter
SLC6A19	solute carrier family 6 (neutral amino acid transporter), member 19	Plasma Membrane	transporter
SLC9B1	solute carrier family 9, subfamily B (NHA1, cation proton antiporter 1), member 1	Plasma Membrane	other
SLCO1A2	solute carrier organic anion transporter family, member 1A2	Plasma Membrane	transporter
SLFN5	schlafen family member 5	Nucleus	enzyme
SLITRK1	SLIT and NTRK-like family, member 1	unknown	other
SLITRK5	SLIT and NTRK-like family, member 5	unknown	other
SMA4	glucuronidase, beta pseudogene	unknown	other
SMAD3	SMAD family member 3	Nucleus	transcription regulator kinase
SMG1	smg-1 homolog, phosphatidylinositol 3-kinase-related kinase (<i>C. elegans</i>)	Cytoplasm	
SMOC1	SPARC related modular calcium binding 1	Extracellular Space	other
SNTB1	syntrophin, beta 1 (dystrophin-associated protein A1, 59 kDa, basic component 1)	Plasma Membrane	other
SOCS2	suppressor of cytokine signaling 2	Cytoplasm	other
SORBS2	sorbin and SH3 domain containing 2	Plasma Membrane	other
SOX11	SRY (sex determining region Y)-box 11	Nucleus	transcription regulator
SOX21	SRY (sex determining region Y)-box 21	Nucleus	transcription regulator
SOX7	SRY (sex determining region Y)-box 7	Nucleus	transcription regulator
SP100	SP100 nuclear antigen	Nucleus	transcription regulator
SPATA17	spermatogenesis associated 17	unknown	other
SPDYA	speedy homolog A (<i>Xenopus laevis</i>)	Nucleus	other
SPINLW1	serine peptidase inhibitor-like, with Kunitz and WAP domains 1 (eppin)	Extracellular Space	other
SPOCK1	sparc/osteonectin, cwcv and kazal-like domains proteoglycan (testican) 1	Extracellular Space	other
SPP1 (includes EG: 20750)	secreted phosphoprotein 1	Extracellular Space	cytokine
SPRED2	sprouty-related, EVH1 domain containing 2	Extracellular Space	cytokine
SPSB3	spla/ryanodine receptor domain and SOCS box containing 3	unknown	other
SPTB	spectrin, beta, erythrocytic	Plasma Membrane	other
SSBP1	single-stranded DNA binding protein 1	Cytoplasm	other
SSPO	SCO-spondin homolog (<i>Bos taurus</i>)	Cytoplasm	other
SSTR1	somatostatin receptor 1	Plasma Membrane	G-protein coupled receptor
SSX4/SSX4B	synovial sarcoma, X breakpoint 4	Nucleus	other
SSX8	synovial sarcoma, X breakpoint 8	unknown	other
ST3GAL6	ST3 beta-galactoside alpha-2,3-sialyltransferase 6	Cytoplasm	enzyme

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
ST6GAL2	ST6 beta-galactosamide alpha-2,6-sialyltransferase 2	Cytoplasm	enzyme
ST6GALNAC2	ST6 (alpha-N-acetyl-neuraminy1,2,3-beta-galactosyl-1,3)-N-acetylgalactosaminide alpha-2,6-sialyltransferase 2	Cytoplasm	enzyme
STAG3L1	stromal antigen 3-like 1	unknown	other
STARD13	STAR-related lipid transfer (START) domain containing 13	Cytoplasm	other
STK31	serine/threonine kinase 31	Cytoplasm	kinase
STK32B	serine/threonine kinase 32B	unknown	kinase
STMN1	stathmin 1	Cytoplasm	other
STMN3	stathmin-like 3	Nucleus	other
STON1-GTF2A1L	STON1-GTF2A1L readthrough	Nucleus	transcription regulator
STRA8	stimulated by retinoic acid gene 8 homolog (mouse)	unknown	other
STS	steroid sulfatase (microsomal), isozyme S	Cytoplasm	enzyme
STX1B	syntaxis 1B	Plasma Membrane	ion channel
SYCE2	synaptonemal complex central element protein 2	Nucleus	other
SYCP3	synaptonemal complex protein 3	Nucleus	other
SYNE2	spectrin repeat containing, nuclear envelope 2	Nucleus	other
SYNPO2	synaptopodin 2	Cytoplasm	other
SYT14	synaptotagmin XIV	unknown	transporter
TAC1	tachykinin, precursor 1	Extracellular Space	other
TACSTD2	tumor-associated calcium signal transducer 2	Plasma Membrane	other
tAKR	aldo-keto reductase, truncated	unknown	enzyme
TAOK1	TAO kinase 1	Cytoplasm	kinase
TAS2R42	taste receptor, type 2, member 42	unknown	other
TBX4	T-box 4	Nucleus	transcription regulator
TCEA3	transcription elongation factor A (SII), 3	Nucleus	transcription regulator
TCF12	transcription factor 12	Nucleus	transcription regulator
TCL1B	T-cell leukemia/lymphoma 1B	unknown	other
TCTEX1D1	Tctex1 domain containing 1	unknown	other
TDH	L-threonine dehydrogenase	Cytoplasm	enzyme
TEDDM1	transmembrane epididymal protein 1	unknown	other
TFAP2A	transcription factor AP-2 alpha (activating enhancer binding protein 2 alpha)	Nucleus	transcription regulator
TFAP2D	transcription factor AP-2 delta (activating enhancer binding protein 2 delta)	Nucleus	transcription regulator
TGFB3	transforming growth factor, beta 3	Extracellular Space	growth factor
TGM4	transglutaminase 4 (prostate)	Extracellular Space	enzyme
THBS1	thrombospondin 1	Extracellular Space	other
THPO	thrombopoietin	Extracellular Space	cytokine
THRA (includes EG: 21833)	thyroid hormone receptor, alpha	Nucleus	ligand-dependent nuclear receptor
THSD7B	thrombospondin, type I, domain containing 7B	unknown	other
TIMM17B	translocase of inner mitochondrial membrane 17 homolog B (yeast)	Cytoplasm	transporter
TIMP2 (includes EG: 21858)	TIMP metallopeptidase inhibitor 2	Extracellular Space	other
TINAG	tubulointerstitial nephritis antigen	Extracellular Space	peptidase
TLL1	tolloid-like 1	Extracellular Space	peptidase
TLR4	toll-like receptor 4	Plasma Membrane	transmembrane receptor
TLX1	T-cell leukemia homeobox 1	Nucleus	transcription regulator
TM4SF18	transmembrane 4 L six family member 18	unknown	other
TM4SF4	transmembrane 4 L six family member 4	Plasma Membrane	other
TMC3	transmembrane channel-like 3	unknown	other
TMEM192	transmembrane protein 192	unknown	other
TMEM37	transmembrane protein 37	Plasma Membrane	ion channel
TMEM45B	transmembrane protein 45B	Extracellular Space	other
TMEM47	transmembrane protein 47	Plasma Membrane	other
TMEM56	transmembrane protein 56	unknown	other
TMPRSS11A	transmembrane protease, serine 11A	unknown	peptidase
TNFAIP6	tumor necrosis factor, alpha-induced protein 6	Extracellular Space	other
TNFRSF10C	tumor necrosis factor receptor superfamily, member 10c, decoy without an intracellular domain	Plasma Membrane	transmembrane receptor
TNFRSF19	tumor necrosis factor receptor superfamily, member 19	Plasma Membrane	transmembrane receptor
TP73	tumor protein p73	Nucleus	transcription regulator

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
TPSD1	tryptase delta 1	Extracellular Space	peptidase
TRAM2	translocation associated membrane protein 2	unknown	other
TRIB1	tribbles homolog 1 (<i>Drosophila</i>)	Cytoplasm	kinase
TRIM22	tripartite motif containing 22	Cytoplasm	transcription regulator
TRIM34	tripartite motif containing 34	Cytoplasm	other
TRIM49	tripartite motif containing 49	unknown	other
TRIM6	tripartite motif containing 6	Cytoplasm	other
TRIM72	tripartite motif containing 72	Cytoplasm	other
TRIML1	tripartite motif family-like 1	unknown	other
TRIML2	tripartite motif family-like 2	unknown	other
TRPM1	transient receptor potential cation channel, subfamily M, member 1	Plasma Membrane	ion channel
TRPM6	transient receptor potential cation channel, subfamily M, member 6	Plasma Membrane	kinase
TRPV1	transient receptor potential cation channel, subfamily V, member 1	Plasma Membrane	ion channel
TSPAN11	tetraspanin 11	unknown	other
TSPAN12	tetraspanin 12	Plasma Membrane	transmembrane receptor
TSPAN8	tetraspanin 8	Plasma Membrane	other
TTC18	tetratricopeptide repeat domain 18	unknown	other
TTC23L	tetratricopeptide repeat domain 23-like	unknown	other
TTLL10	tubulin tyrosine ligase-like family, member 10	Extracellular Space	other
TTN (includes EG: 22138)	titin	Cytoplasm	kinase
TPPA	tocopherol (alpha) transfer protein	Cytoplasm	transporter
TTTY2	testis-specific transcript, Y-linked 2 (non-protein coding)	Nucleus	other
TTTY8	testis-specific transcript, Y-linked 8 (non-protein coding)	unknown	other
TUSC5	tumor suppressor candidate 5	unknown	other
TXNRD2	thioredoxin reductase 2	Cytoplasm	enzyme
UACA	veal autoantigen with coiled-coil domains and ankyrin repeats	Cytoplasm	other
UBE2M	ubiquitin-conjugating enzyme E2M	Cytoplasm	enzyme
UBE2R2	ubiquitin-conjugating enzyme E2R 2	unknown	enzyme
UBN2	ubinuclein 2	Nucleus	other
UCA1	urothelial cancer associated 1 (non-protein coding)	unknown	other
UCP1	uncoupling protein 1 (mitochondrial, proton carrier)	Cytoplasm	transporter
UGT3A1	UDP glycosyltransferase 3 family, polypeptide A1	unknown	enzyme
ULK2	unc-51-like kinase 2 (<i>C. elegans</i>)	Cytoplasm	kinase
UNC80	unc-80 homolog (<i>C. elegans</i>)	unknown	other
USP11	ubiquitin specific peptidase 11	Nucleus	peptidase
USP38	ubiquitin specific peptidase 38	unknown	peptidase
UTS2	urotensin 2	Extracellular Space	other
UTS2D	urotensin 2 domain containing	Extracellular Space	other
VEZF1	vascular endothelial zinc finger 1	Nucleus	transcription regulator
VN1R4	vomeronasal 1 receptor 4	Plasma Membrane	G-protein coupled receptor
VPS54 (includes EG: 245944)	vacuolar protein sorting 54 homolog (<i>S. cerevisiae</i>)	unknown	other
VSNL1	visinin-like 1	Cytoplasm	other
VSTM4	V-set and transmembrane domain containing 4	unknown	other
VWA1	von Willebrand factor A domain containing 1	Extracellular Space	other
VWA3B	von Willebrand factor A domain containing 3B	unknown	other
WASF2	WAS protein family, member 2	Cytoplasm	other
WDFY3-AS2	WDFY3 antisense RNA 2 (non-protein coding)	unknown	other
WDR17	WD repeat domain 17	unknown	other
WDR45	WD repeat domain 45	unknown	other
WDR49	WD repeat domain 49	unknown	other
WDR65	WD repeat domain 65	unknown	other
WDR72	WD repeat domain 72	unknown	other
WDR96	WD repeat domain 96	unknown	other
WFDC11	WAP four-disulfide core domain 11	Extracellular Space	other
WFDC5	WAP four-disulfide core domain 5	Extracellular Space	other
WFDC6	WAP four-disulfide core domain 6	Extracellular Space	other
WFDC9	WAP four-disulfide core domain 9	Extracellular Space	other
WLS	wntless homolog (<i>Drosophila</i>)	Cytoplasm	other
WNT8B	wingless-type MMTV integration site family, member 8B	Extracellular Space	other
WWP2	WW domain containing E3 ubiquitin protein ligase 2	Cytoplasm	enzyme
XIRP2	xin actin-binding repeat containing 2	unknown	other
XRN1	5'-3' exoribonuclease 1	Cytoplasm	enzyme

TABLE 1-continued

Rapamycin-sensitive genes (1051 genes)			
Symbol	Entrez Gene Name	Location	Type(s)
XYLB	xylulokinase homolog (<i>H. influenzae</i>)	unknown	kinase
YPEL1	yippee-like 1 (<i>Drosophila</i>)	Nucleus	enzyme
YPEL2	yippee-like 2 (<i>Drosophila</i>)	Nucleus	other
YPEL5	yippee-like 5 (<i>Drosophila</i>)	unknown	other
ZADH2	zinc binding alcohol dehydrogenase domain containing 2	Cytoplasm	enzyme
ZBTB10	zinc finger and BTB domain containing 10	Nucleus	other
ZBTB20	zinc finger and BTB domain containing 20	Nucleus	other
ZC3H6	zinc finger CCCH-type containing 6	unknown	other
ZCCHC12	zinc finger, CCHC domain containing 12	unknown	other
ZDHHC15	zinc finger, DHHC-type containing 15	unknown	enzyme
ZFYVE16	zinc finger, FYVE domain containing 16	Nucleus	transporter
ZIC4	Zic family member 4	Nucleus	other
ZMAT1	zinc finger, matrin-type 1	Nucleus	other
ZNF292	zinc finger protein 292	Nucleus	transcription regulator
ZNF385B	zinc finger protein 385B	Nucleus	other
ZNF445	zinc finger protein 445	Nucleus	transcription regulator
ZNF45	zinc finger protein 45	Nucleus	transcription regulator
ZNF471	zinc finger protein 471	Nucleus	other
ZNF572	zinc finger protein 572	Nucleus	other
ZNF695	zinc finger protein 695	Nucleus	other
ZNF704	zinc finger protein 704	unknown	other
ZNF711	zinc finger protein 711	Nucleus	other
ZNF804A	zinc finger protein 804A	unknown	other
ZNF81	zinc finger protein 81	Nucleus	transcription regulator
ZSCAN4	zinc finger and SCAN domain containing 4	Nucleus	transcription regulator

TABLE 2

Rapamycin-sensitive genes differentially regulated in brain of Alzheimer's disease patients with mild disease (112 known genes)				
Symbol	Entrez Gene Name	Location	Type(s)	Fold Change
ABTB1	ankyrin repeat and BTB (POZ) domain containing 1	Cytoplasm	translation regulator	1.057
ADAMTS2	ADAM metallopeptidase with thrombospondin type 1 motif, 2	Extracellular Space	peptidase	1.083
ADAMTS5	ADAMTS-like 5	Extracellular Space	other	1.088
AHNAK2	AHNAK nucleoprotein 2	unknown	other	1.056
B4GALT6	UDP-Gal: betaGlcNAc beta 1,4-galactosyltransferase, polypeptide 6	Cytoplasm	enzyme	1.022
BARX2	BARX homeobox 2	Nucleus	transcription regulator	1.077
BMP7	bone morphogenetic protein 7	Extracellular Space	growth factor	1.035
BTNL9	butyrophilin-like 9	unknown	other	1.056
C17orf99	chromosome 17 open reading frame 99	unknown	other	1.032
C1orf127	chromosome 1 open reading frame 127	unknown	other	1.074
CACNA1D	calcium channel, voltage-dependent, L type, alpha 1D subunit	Plasma Membrane	ion channel	1.063
CARD14	caspase recruitment domain family, member 14	Cytoplasm	other	1.034
CC2D2A	coiled-coil and C2 domain containing 2A	unknown	other	1.102
CCL1	chemokine (C—C motif) ligand 1	Extracellular Space	cytokine	1.066
CCL11	chemokine (C—C motif) ligand 11	Extracellular Space	cytokine	1.048
CCL2	chemokine (C—C motif) ligand 2	Extracellular Space	cytokine	1.061
CCR1	chemokine (C—C motif) receptor 1	Plasma Membrane	G-protein coupled receptor	1.034
CD69	CD69 molecule	Plasma Membrane	transmembrane receptor	1.028
CDKN2C	cyclin-dependent kinase inhibitor 2C (p18, inhibits CDK4)	Nucleus	transcription regulator	1.056
CEACAM1 (includes others)	carcinoembryonic antigen-related cell adhesion molecule 1 (biliary glycoprotein)	Plasma Membrane	transmembrane receptor	1.079
CEP68	centrosomal protein 68 kDa	Cytoplasm	other	1.036
COL1A2	collagen, type I, alpha 2	Extracellular Space	other	1.043
CPXM2	carboxypeptidase X (M14 family), member 2	Extracellular Space	peptidase	1.026
CREB3L4	cAMP responsive element binding protein 3-like 4	Nucleus	transcription regulator	1.064
CRP	C-reactive protein, pentraxin-related	Extracellular Space	other	1.104
CTDSP1	CTD (carboxy-terminal domain, RNA polymerase II, polypeptide A) small phosphatase 1	Nucleus	phosphatase	1.098
DCAF12L1	DDB1 and CUL4 associated factor 12-like 1	unknown	other	1.030
DCD	dermcidin	Extracellular Space	other	1.159
DRP2	dystrophin related protein 2	Plasma Membrane	other	1.043

TABLE 2-continued

Rapamycin-sensitive genes differentially regulated in brain of Alzheimer's disease patients with mild disease (112 known genes)				
Symbol	Entrez Gene Name	Location	Type(s)	Fold Change
EBF2	early B-cell factor 2	Nucleus	other	1.028
ENTPD8	ectonucleoside triphosphate diphosphohydrolase 8	unknown	enzyme	1.071
FAM43B	family with sequence similarity 43, member B	unknown	other	1.061
FAM64A	family with sequence similarity 64, member A	Nucleus	other	1.214
FCGBP	Fc fragment of IgG binding protein	Extracellular Space	other	1.057
FGF11	fibroblast growth factor 11	Extracellular Space	growth factor	1.169
FJX1	four jointed box 1 (<i>Drosophila</i>)	Extracellular Space	other	1.123
FLJ35946	uncharacterized protein FLJ35946	unknown	other	1.148
FN3K	fructosamine 3 kinase	Cytoplasm	kinase	1.258
GLI2	GLI family zinc finger 2	Nucleus	transcription regulator	1.032
GLP1R	glucagon-like peptide 1 receptor	Plasma Membrane	G-protein coupled receptor	1.031
GLRA1	glycine receptor, alpha 1	Plasma Membrane	ion channel	1.041
GPR176	G protein-coupled receptor 176	Plasma Membrane	G-protein coupled receptor	1.092
HCAR3	hydroxycarboxylic acid receptor 3	Plasma Membrane	G-protein coupled receptor	1.041
HDAC5	histone deacetylase 5	Nucleus	transcription regulator	1.112
HHIPL1	HHIP-like 1	unknown	other	1.057
HMGCS2	3-hydroxy-3-methylglutaryl-CoA synthase 2 (mitochondrial)	Cytoplasm	enzyme	1.044
HOXD10	homeobox D10	Nucleus	transcription regulator	1.024
HYDIN	HYDIN, axonemal central pair apparatus protein	unknown	other	1.077
IL6	interleukin 6 (interferon, beta 2)	Extracellular Space	cytokine	1.034
KLF2	Kruppel-like factor 2 (lung)	Nucleus	transcription regulator	1.084
LECT1	leukocyte cell derived chemotaxin 1	Extracellular Space	other	1.062
LINC00473	long intergenic non-protein coding RNA 473	unknown	other	1.097
LOC100129775	uncharacterized LOC100129775	unknown	other	1.047
LOC100505890	uncharacterized LOC100505890	unknown	other	1.025
LOC100506206	uncharacterized LOC100506206	unknown	other	1.192
LOC100506236	uncharacterized LOC100506236	unknown	other	1.126
LOC100507492	uncharacterized LOC100507492	unknown	other	1.086
LOC100507520	uncharacterized LOC100507520	unknown	other	1.495
LOC285740	uncharacterized LOC285740	unknown	other	1.027
LOC389043	uncharacterized LOC389043	unknown	other	1.330
LOC400752	uncharacterized LOC400752	unknown	other	1.115
LOC401317	uncharacterized LOC401317	unknown	other	1.034
LOC728724	hCG1814486	unknown	other	1.051
LOXL4	lysyl oxidase-like 4	Extracellular Space	enzyme	1.122
LUM	lumican	Extracellular Space	other	1.073
LYPD2	LY6/PLAUR domain containing 2	unknown	other	1.101
MAPK4	mitogen-activated protein kinase 4	Cytoplasm	kinase	1.103
MFAPI5	microfibrillar associated protein 5	Extracellular Space	other	1.024
MGC24103	uncharacterized MGC24103	unknown	other	1.045
MGC39545	uncharacterized LOC403312	unknown	other	1.026
MOXD1	monooxygenase, DBH-like 1	Cytoplasm	enzyme	1.124
MYF6	myogenic factor 6 (herculin)	Nucleus	transcription regulator	1.127
NCKAP1	NCK-associated protein 1	Plasma Membrane	other	1.043
NR3C1	nuclear receptor subfamily 3, group C, member 1 (glucocorticoid receptor)	Nucleus	ligand-dependent nuclear receptor	1.058
NTSR1	neurotensin receptor 1 (high affinity)	Plasma Membrane	G-protein coupled receptor	1.058
OR52B2	olfactory receptor, family 52, subfamily B, member 2	Plasma Membrane	G-protein coupled receptor	1.051
OTOGL	otogelin-like	unknown	other	1.039
PAOX	polyamine oxidase (exo-N4-amino)	Cytoplasm	enzyme	1.043
PBX1	pre-B-cell leukemia homeobox 1	Nucleus	transcription regulator	1.021
PHLDA3	pleckstrin homology-like domain, family A, member 3	Plasma Membrane	other	1.056
PIM1	pim-1 oncogene	Cytoplasm	kinase	1.041
PLD4	phospholipase D family, member 4	unknown	enzyme	1.087
POU4F2	POU class 4 homeobox 2	Nucleus	transcription regulator	1.040
PRKCH	protein kinase C, eta	Cytoplasm	kinase	1.169
PRODH2	proline dehydrogenase (oxidase) 2	Cytoplasm	enzyme	1.056
PVR3	poliovirus receptor-related 3	Plasma Membrane	other	1.064
RELN	reelin	Extracellular Space	peptidase	1.113
RHO	rhodopsin	Plasma Membrane	G-protein coupled receptor	1.024
RHOT1	ras homolog family member T1	Cytoplasm	enzyme	1.029
RPS6KB2	ribosomal protein S6 kinase, 70 kDa, polypeptide 2	Cytoplasm	kinase	1.077
RUNX1T1	runt-related transcription factor 1; translocated to, 1 (cyclin D-related)	Nucleus	transcription regulator	1.053
SEMA4C	sema domain, immunoglobulin domain (Ig), transmembrane domain (TM) and short cytoplasmic domain, (semaphorin) 4C	Plasma Membrane	other	1.135
SEMAS5A	sema domain, seven thrombospondin repeats (type 1 and type 1-like), transmembrane domain (TM) and short cytoplasmic domain, (semaphorin) 5A	Plasma Membrane	transmembrane receptor	1.092

TABLE 2-continued

Rapamycin-sensitive genes differentially regulated in brain of Alzheimer's disease patients with mild disease (112 known genes)				
Symbol	Entrez Gene Name	Location	Type(s)	Fold Change
SERPIND1	serpin peptidase inhibitor, clade D (heparin cofactor), member 1	Extracellular Space	other	1.030
SERPINE1	serpin peptidase inhibitor, clade E (nexin, plasminogen activator inhibitor type 1), member 1	Extracellular Space	other	1.091
SHE	Src homology 2 domain containing E	Cytoplasm	other	1.030
SLC18A3	solute carrier family 18 (vesicular acetylcholine), member 3	Plasma Membrane	transporter	1.056
SLC22A18	solute carrier family 22, member 18	Plasma Membrane	transporter	1.173
SLC22A7	solute carrier family 22 (organic anion transporter), member 7	Plasma Membrane	transporter	1.077
SLC38A3	solute carrier family 38, member 3	Plasma Membrane	transporter	1.033
SMAD3	SMAD family member 3	Nucleus	transcription regulator	1.042
STARD13	StAR-related lipid transfer (START) domain containing 13	Cytoplasm	other	1.269
TM4SF4	transmembrane 4 L six family member 4	Plasma Membrane	other	1.024
TNFRSF10C	tumor necrosis factor receptor superfamily, member 10c, decoy without an intracellular domain	Plasma Membrane	transmembrane receptor	1.030
TRIB1	tribbles homolog 1 (<i>Drosophila</i>)	Cytoplasm	kinase	1.041
TRPV1	transient receptor potential cation channel, subfamily V, member 1	Plasma Membrane	ion channel	1.037
TTC18	tetratricopeptide repeat domain 18	unknown	other	1.072
UCA1	urothelial cancer associated 1 (non-protein coding)	unknown	other	1.041
WFDC9	WAP four-disulfide core domain 9	Extracellular Space	other	1.052
XRN1	5'-3' exoribonuclease 1	Cytoplasm	enzyme	1.027
ZADH2	zinc binding alcohol dehydrogenase domain containing 2	Cytoplasm	enzyme	1.129
ZBTB20	zinc finger and BTB domain containing 20	Nucleus	other	1.044

TABLE 3

Rapamycin-sensitive genes differentially regulated in brain of Alzheimer's disease patients with advanced disease (178 known genes)				
Symbol	Entrez Gene Name	Location	Type(s)	Fold Change
ABLM2	actin binding LIM protein family, member 2	Cytoplasm	other	0.905
ABTB1	ankyrin repeat and BTB (POZ) domain containing 1	Cytoplasm	translation regulator	1.058
ACSL6	acyl-CoA synthetase long-chain family member 6	Cytoplasm	enzyme	0.937
ACTRT1	actin-related protein T1	Cytoplasm	other	1.025
ACVR2B	activin A receptor, type IIB	Plasma Membrane	kinase	1.038
ADAMTS2	ADAM metallopeptidase with thrombospondin type 1 motif, 2	Extracellular Space	peptidase	1.082
ADAMTSL5	ADAMTS-like 5	Extracellular Space	other	1.094
AHNAK2	AHNAK nucleoprotein 2	unknown	other	1.056
ANKRD36BP2	ankyrin repeat domain 36B pseudogene 2	unknown	other	0.913
AP1S1	adaptor-related protein complex 1, sigma 1 subunit	Cytoplasm	transporter	0.955
ATAD3A/ATAD3B	ATPase family, AAA domain containing 3A	Nucleus	other	1.078
ATF7IP	activating transcription factor 7 interacting protein	Nucleus	transcription regulator	0.934
ATRN1L	attractin-like 1	unknown	other	0.865
BARX2	BARX homeobox 2	Nucleus	transcription regulator	1.080
BCOR	BCL6 corepressor	Nucleus	transcription regulator	1.032
BMP7	bone morphogenetic protein 7	Extracellular Space	growth factor	1.046
BPI	bactericidal/permeability-increasing protein	Plasma Membrane	transporter	1.036
BTNL9	butyrophilin-like 9	unknown	other	1.063
C17orf99	chromosome 17 open reading frame 99	unknown	other	1.039
C18orf26	chromosome 18 open reading frame 26	unknown	other	0.960
C1orf127	chromosome 1 open reading frame 127	unknown	other	1.087
C3orf80	chromosome 3 open reading frame 80	unknown	other	0.952
CACNA1D	calcium channel, voltage-dependent, L type, alpha 1D subunit	Plasma Membrane	ion channel	1.070
CARD14	caspase recruitment domain family, member 14	Cytoplasm	other	1.025
CC2D2A	coiled-coil and C2 domain containing 2A	unknown	other	1.098
CCL1	chemokine (C—C motif) ligand 1	Extracellular Space	cytokine	1.063
CCL11	chemokine (C—C motif) ligand 11	Extracellular Space	cytokine	1.039
CCL2	chemokine (C—C motif) ligand 2	Extracellular Space	cytokine	1.082
CCNB2	cyclin B2	Cytoplasm	other	1.073
CCR1	chemokine (C—C motif) receptor 1	Plasma Membrane	G-protein coupled receptor	1.032
CEACAM1 (includes others)	carcinoembryonic antigen-related cell adhesion molecule 1 (biliary glycoprotein)	Plasma Membrane	transmembrane receptor	1.081
CEP68	centrosomal protein 68 kDa	Cytoplasm	other	1.040
CLU	clusterin	Extracellular Space	other	0.911
CPLX2	complexin 2	Cytoplasm	other	0.918
CPXM2	carboxypeptidase X (M14 family), member 2	Extracellular Space	peptidase	1.030

TABLE 3-continued

Rapamycin-sensitive genes differentially regulated in brain of Alzheimer's disease patients with advanced disease (178 known genes)				
Symbol	Entrez Gene Name	Location	Type(s)	Fold Change
CREB3L4	cAMP responsive element binding protein 3-like 4	Nucleus	transcription regulator	1.054
CRP	C-reactive protein, pentraxin-related	Extracellular Space	other	1.111
CTDSP1	CTD (carboxy-terminal domain, RNA polymerase II, polypeptide A) small phosphatase 1	Nucleus	phosphatase	1.119
CUX1	cut-like homeobox 1	Nucleus	transcription regulator	0.969
DCAF12L1	DDB1 and CUL4 associated factor 12-like 1	unknown	other	1.038
DCD	dermcidin	Extracellular Space	other	1.152
DCLK1	doublecortin-like kinase 1	Plasma Membrane	kinase	0.939
DLG2	discs, large homolog 2 (<i>Drosophila</i>)	Plasma Membrane	kinase	0.917
DNAH6	dynein, axonemal, heavy chain 6	unknown	other	0.957
DRP2	dystrophin related protein 2	Plasma Membrane	other	1.038
DYNC2LI1	dynein, cytoplasmic 2, light intermediate chain 1	Cytoplasm	other	0.946
DZIP3	DAZ interacting protein 3, zinc finger	Cytoplasm	enzyme	0.905
EBF2	early B-cell factor 2	Nucleus	other	1.024
EIF4E	eukaryotic translation initiation factor 4E	Cytoplasm	translation regulator	0.920
ELAVL4	ELAV (embryonic lethal, abnormal vision, <i>Drosophila</i>)-like 4 (Hu antigen D)	Cytoplasm	other	0.931
ENTPD8	ectonucleoside triphosphate diphosphohydrolase 8	unknown	enzyme	1.063
FAM155A	family with sequence similarity 155, member A	unknown	other	0.860
FAM171B	family with sequence similarity 171, member B	unknown	other	0.948
FAM64A	family with sequence similarity 64, member A	Nucleus	other	1.154
FAT3	FAT tumor suppressor homolog 3 (<i>Drosophila</i>)	unknown	other	0.954
FGF11	fibroblast growth factor 11	Extracellular Space	growth factor	1.185
FJX1	four jointed box 1 (<i>Drosophila</i>)	Extracellular Space	other	1.104
FLJ35946	uncharacterized protein FLJ35946	unknown	other	1.137
FN3K	fructosamine 3 kinase	Cytoplasm	kinase	1.269
GABBR2	gamma-aminobutyric acid (GABA) B receptor, 2	Plasma Membrane	G-protein coupled receptor	0.862
GALNT10	UDP-N-acetyl-alpha-D-galactosamine: polypeptide N-acetylgalactosaminyltransferase 10 (GalNAc-T10)	Cytoplasm	enzyme	1.064
GFAP	glial fibrillary acidic protein	Cytoplasm	other	1.091
GIGYF1	GRB10 interacting GYF protein 1	unknown	other	1.042
GLI2	GLI family zinc finger 2	Nucleus	transcription regulator	1.033
GLRA1	glycine receptor, alpha 1	Plasma Membrane	ion channel	1.043
GNG8	guanine nucleotide binding protein (G protein), gamma 8	Plasma Membrane	enzyme	1.059
GPM6A	glycoprotein M6A	Plasma Membrane	ion channel	0.920
GPR176	G protein-coupled receptor 176	Plasma Membrane	G-protein coupled receptor	1.098
GSG1L	GSG1-like	unknown	other	1.025
HCAR3	hydroxycarboxylic acid receptor 3	Plasma Membrane	G-protein coupled receptor	1.053
HDAC5	histone deacetylase 5	Nucleus	transcription regulator	1.125
HHIP1	HHIP-like 1	unknown	other	1.063
HIST1H4A (includes others)	histone cluster 1, H4a	Nucleus	other	0.894
HMGCS2	3-hydroxy-3-methylglutaryl-CoA synthase 2 (mitochondrial)	Cytoplasm	enzyme	1.034
HOXD10	homeobox D10	Nucleus	transcription regulator	1.038
HYDIN	HYDIN, axonemal central pair apparatus protein	unknown	other	1.090
IL1RAPL1	interleukin 1 receptor accessory protein-like 1	Plasma Membrane	transmembrane receptor	1.029
IL6	interleukin 6 (interferon, beta 2)	Extracellular Space	cytokine	1.037
IRS2	insulin receptor substrate 2	Cytoplasm	enzyme	0.925
IRS2	insulin receptor substrate 2	Cytoplasm	enzyme	0.941
IRX4	iroquois homeobox 4	Nucleus	transcription regulator	1.032
ITGBL1	integrin, beta-like 1 (with EGF-like repeat domains)	unknown	other	1.038
KCNAB1	potassium voltage-gated channel, shaker-related subfamily, beta member 1	Plasma Membrane	ion channel	0.936
KCND2	potassium voltage-gated channel, Shal-related subfamily, member 2	Plasma Membrane	ion channel	0.958
KCNG4	potassium voltage-gated channel, subfamily G, member 4	Plasma Membrane	ion channel	1.152
KIAA1683	KIAA1683	Cytoplasm	other	1.046
KLF2	Kruppel-like factor 2 (lung)	Nucleus	transcription regulator	1.103
KRTAP9-2	keratin associated protein 9-2	unknown	other	1.022
LECT1	leukocyte cell derived chemotaxin 1	Extracellular Space	other	1.060
LINC00473	long intergenic non-protein coding RNA 473	unknown	other	1.085
LOC100129775	uncharacterized LOC100129775	unknown	other	1.051
LOC100287803	uncharacterized LOC100287803	unknown	other	0.854
LOC100506206	uncharacterized LOC100506206	unknown	other	1.199
LOC100506236	uncharacterized LOC100506236	unknown	other	1.127
LOC100507492	uncharacterized LOC100507492	unknown	other	1.080
LOC100507520	uncharacterized LOC100507520	unknown	other	1.497
LOC285740	uncharacterized LOC285740	unknown	other	1.024
LOC389043	uncharacterized LOC389043	unknown	other	1.255
LOC400752	uncharacterized LOC400752	unknown	other	1.113
LOC401317	uncharacterized LOC401317	unknown	other	1.037

TABLE 3-continued

Rapamycin-sensitive genes differentially regulated in brain of Alzheimer's disease patients with advanced disease (178 known genes)				
Symbol	Entrez Gene Name	Location	Type(s)	Fold Change
LOC728323	uncharacterized LOC728323	unknown	other	0.921
LOC728724	hCG1814486	unknown	other	1.070
LOXL4	lysyl oxidase-like 4	Extracellular Space	enzyme	1.136
LRRC71	leucine rich repeat containing 71	unknown	other	1.052
LUM	lumican	Extracellular Space	other	1.069
LYPD2	LY6/PLAUR domain containing 2	unknown	other	1.102
MAPK1	mitogen-activated protein kinase 1	Cytoplasm	kinase	0.912
MAPK4	mitogen-activated protein kinase 4	Cytoplasm	kinase	1.100
MBD3L2 (includes others)	methyl-CpG binding domain protein 3-like 2	unknown	other	1.025
MCTP1	multiple C2 domains, transmembrane 1	unknown	other	0.914
MECOM	MDS1 and EVI1 complex locus	Nucleus	transcription regulator	1.024
MFAP5	microfibrillar associated protein 5	Extracellular Space	other	1.026
MGC24103	uncharacterized MGC24103	unknown	other	1.050
MMP16	matrix metallopeptidase 16 (membrane-inserted)	Extracellular Space	peptidase	0.928
MOXD1	monooxygenase, DBH-like 1	Cytoplasm	enzyme	1.103
MYF6	myogenic factor 6 (herculin)	Nucleus	transcription regulator	1.136
NAV2	neuron navigator 2	Nucleus	other	1.037
NCKAP1	NCK-associated protein 1	Plasma Membrane	other	1.043
NHSL1	NHS-like 1	unknown	other	0.960
NR3C1	nuclear receptor subfamily 3, group C, member 1 (glucocorticoid receptor)	Nucleus	ligand-dependent nuclear receptor	1.078
NTSR1	neurotensin receptor 1 (high affinity)	Plasma Membrane	G-protein coupled receptor	1.053
OIP5-AS1	OIP5 antisense RNA 1 (non-protein coding)	unknown	other	0.888
OR52B2	olfactory receptor, family 52, subfamily B, member 2	Plasma Membrane	G-protein coupled receptor	1.065
OTOG	otogelin-like	unknown	other	1.031
PEX5L	peroxisomal biogenesis factor 5-like	Cytoplasm	ion channel	0.932
PHLDA3	pleckstrin homology-like domain, family A, member 3	Plasma Membrane	other	1.067
PIM1	pim-1 oncogene	Cytoplasm	kinase	1.054
PLD4	phospholipase D family, member 4	unknown	enzyme	1.085
POU4F2	POU class 4 homeobox 2	Nucleus	transcription regulator	1.034
PRKCH	protein kinase C, eta	Cytoplasm	kinase	1.156
PRODH2	proline dehydrogenase (oxidase) 2	Cytoplasm	enzyme	1.062
PVR3	poliovirus receptor-related 3	Plasma Membrane	other	1.066
PYCR1	pyrroline-5-carboxylate reductase 1	Cytoplasm	enzyme	1.048
RAB3C (includes EG: 115827)	RAB3C, member RAS oncogene family	Cytoplasm	enzyme	0.941
RELN	reelin	Extracellular Space	peptidase	1.081
RM12	RM12, RecQ mediated genome instability 2, homolog (<i>S. cerevisiae</i>)	unknown	other	1.069
RND3	Rho family GTPase 3	Cytoplasm	enzyme	1.026
RNF128	ring finger protein 128, E3 ubiquitin protein ligase	Cytoplasm	enzyme	0.952
RPS6KB2	ribosomal protein S6 kinase, 70 kDa, polypeptide 2	Cytoplasm	kinase	1.098
RUNX1T1	runt-related transcription factor 1; translocated to, 1 (cyclin D-related)	Nucleus	transcription regulator	1.055
SCGN	secretagogin, EF-hand calcium binding protein	Cytoplasm	other	1.037
SCN8A	sodium channel, voltage gated, type VIII, alpha subunit	Plasma Membrane	ion channel	0.924
SEMA4C	sema domain, immunoglobulin domain (Ig), transmembrane domain (TM) and short cytoplasmic domain, (semaphorin) 4C	Plasma Membrane	other	1.146
SEMA5A	sema domain, seven thrombospondin repeats (type 1 and type 1-like), transmembrane domain (TM) and short cytoplasmic domain, (semaphorin) 5A	Plasma Membrane	transmembrane receptor	1.083
SERPINA10	serpin peptidase inhibitor, clade A (alpha-1 antiproteinase, antitrypsin), member 10	Extracellular Space	other	1.029
SERPIND1	serpin peptidase inhibitor, clade D (heparin cofactor), member 1	Extracellular Space	other	1.036
SERPINE1	serpin peptidase inhibitor, clade E (nexin, plasminogen activator inhibitor type 1), member 1	Extracellular Space	other	1.093
SHE	Src homology 2 domain containing E	Cytoplasm	other	1.043
SLC18A3	solute carrier family 18 (vesicular acetylcholine), member 3	Plasma Membrane	transporter	1.056
SLC22A18	solute carrier family 22, member 18	Plasma Membrane	transporter	1.176
SLC22A7	solute carrier family 22 (organic anion transporter), member 7	Plasma Membrane	transporter	1.082
SLC25A27	solute carrier family 25, member 27	Cytoplasm	transporter	0.952
SLC38A3	solute carrier family 38, member 3	Plasma Membrane	transporter	1.046
SLITRK1	SLIT and NTRK-like family, member 1	unknown	other	0.917
SLITRK1	SLIT and NTRK-like family, member 1	unknown	other	0.948
SMAD3	SMAD family member 3	Nucleus	transcription regulator	1.042
SORBS2	sorbin and SH3 domain containing 2	Plasma Membrane	other	0.961
STAG3L1	stromal antigen 3-like 1	unknown	other	1.088
STARD13	StAR-related lipid transfer (START) domain containing 13	Cytoplasm	other	1.221
STX1B	syntaxis 1B	Plasma Membrane	ion channel	0.915
SYCP3	synaptosomal complex protein 3	Nucleus	other	1.023

TABLE 3-continued

Rapamycin-sensitive genes differentially regulated in brain of Alzheimer's disease patients with advanced disease (178 known genes)				
Symbol	Entrez Gene Name	Location	Type(s)	Fold Change
TAOK1	TAO kinase 1	Cytoplasm	kinase	0.965
TGTM4	transglutaminase 4 (prostate)	Extracellular Space	enzyme	1.086
TIMM17B	translocase of inner mitochondrial membrane 17 homolog B (yeast)	Cytoplasm	transporter	1.035
TMEM56	transmembrane protein 56	unknown	other	0.947
TNFRSF10C	tumor necrosis factor receptor superfamily, member 10c, decoy without an intracellular domain	Plasma Membrane	transmembrane receptor	1.028
TP73	tumor protein p73	Nucleus	transcription regulator	1.045
TRPV1	transient receptor potential cation channel, subfamily V, member 1	Plasma Membrane	ion channel	1.032
TSC2	tuberous sclerosis 2	Cytoplasm	other	1.045
UCA1	urothelial cancer associated 1 (non-protein coding)	unknown	other	1.040
VEGFA	vascular endothelial growth factor A	Extracellular Space	growth factor	1.090
VSNL1	visinin-like 1	Cytoplasm	other	0.848
WFDC11	WAP four-disulfide core domain 11	Extracellular Space	other	1.030
XRN1	5'-3' exoribonuclease 1	Cytoplasm	enzyme	1.023
YPEL1	yippee-like 1 (<i>Drosophila</i>)	Nucleus	enzyme	0.934
ZADH2	zinc binding alcohol dehydrogenase domain containing 2	Cytoplasm	enzyme	1.133
ZBTB20	zinc finger and BTB domain containing 20	Nucleus	other	1.052
ZC3H6	zinc finger CCCH-type containing 6	unknown	other	0.928

TABLE 4

Rapamycin-sensitive genes differentially regulated in brain of Alzheimer's disease patients with mild disease - new targets				
Symbol	Entrez Gene Name	Location	Type(s)	Fold Change
ABTB1	ankyrin repeat and BTB (POZ) domain containing 1	Cytoplasm	translation regulator	1.057
AHNAK2	AHNAK nucleoprotein 2	unknown	other	1.056
BARX2	BARX homeobox 2	Nucleus	transcription regulator	1.077
BTNL9	butyrophilin-like 9	unknown	other	1.056
CACNA1D	calcium channel, voltage-dependent, L type, alpha 1D subunit	Plasma Membrane	ion channel	1.063
CARD14	caspase recruitment domain family, member 14	Cytoplasm	other	1.034
CC2D2A	coiled-coil and C2 domain containing 2A	unknown	other	1.102
CEP68	centrosomal protein 68 kDa	Cytoplasm	other	1.036
CPXM2	carboxypeptidase X (M14 family), member 2	Extracellular Space	peptidase	1.026
CREB3L4	cAMP responsive element binding protein 3-like 4	Nucleus	transcription regulator	1.064
CTDSP1	CTD (carboxy-terminal domain, RNA polymerase II, polypeptide A) small phosphatase 1	Nucleus	phosphatase	1.098
DCAF12L1	DDB1 and CUL4 associated factor 12-like 1	unknown	other	1.030
FAM64A	family with sequence similarity 64, member A	Nucleus	other	1.214
FCGBP	Fc fragment of IgG binding protein	Extracellular Space	other	1.057
FJX1	four jointed box 1 (<i>Drosophila</i>)	Extracellular Space	other	1.123
FN3K	fructosamine 3 kinase	Cytoplasm	kinase	1.258
GLI2	GLI family zinc finger 2	Nucleus	transcription regulator	1.032
GLRA1	glycine receptor, alpha 1	Plasma Membrane	ion channel	1.041
GPR176	G protein-coupled receptor 176	Plasma Membrane	G-protein coupled receptor	1.092
HHIPL1	HHIP-like 1	unknown	other	1.057
HOXD10	homeobox D10	Nucleus	transcription regulator	1.024
HYDIN	HYDIN, axonemal central pair apparatus protein	unknown	other	1.077
KLF2	Kruppel-like factor 2 (lung)	Nucleus	transcription regulator	1.084
MFAP5	microfibrillar associated protein 5	Extracellular Space	other	1.024
PHLDA3	pleckstrin homology-like domain, family A, member 3	Plasma Membrane	other	1.056
POU4F2	POU class 4 homeobox 2	Nucleus	transcription regulator	1.040
RHO	rhodopsin	Plasma Membrane	G-protein coupled receptor	1.024
RUNX1T1	runt-related transcription factor 1; translocated to, 1 (cyclin D-related)	Nucleus	transcription regulator	1.053
STARD13	STAR-related lipid transfer (START) domain containing 13	Cytoplasm	other	1.269
TRIB1	tribbles homolog 1 (<i>Drosophila</i>)	Cytoplasm	kinase	1.041

Rapamycin-sensitive genes differentially regulated in brain of Alzheimer's disease patients with advanced disease - new targets				
Symbol	Entrez Gene Name	Location	Type(s)	Fold Change
ACSL6	acyl-CoA synthetase long-chain family member 6	Cytoplasm	enzyme	0.937
ACTRT1	actin-related protein T1	Cytoplasm	other	1.025
AHNAK2	AHNAK nucleoprotein 2	unknown	other	1.056
AP1S1	adaptor-related protein complex 1, sigma 1 subunit	Cytoplasm	transporter	0.955
ATAD3A/ATAD3B	ATPase family, AAA domain containing 3A	Nucleus	other	1.078
ATF7IP	activating transcription factor 7 interacting protein	Nucleus	transcription regulator	0.934
ATRN1L	actinactin-like 1	unknown	other	0.865
BARX2	BARX homeobox 2	Nucleus	transcription regulator	1.080
BCOR	BCL6 corepressor	Nucleus	transcription regulator	1.032
BTNL9	butyrophilin-like 9	unknown	other	1.063
CACNA1D	calcium channel, voltage-dependent, L type, alpha 1D subunit	Plasma Membrane	ion channel	1.070
CARD14	caspase recruitment domain family, member 14	Cytoplasm	other	1.025
CC2D2A	coiled-coil and C2 domain containing 2A	unknown	other	1.098
CEP68	centrosomal protein 68 kDa	Cytoplasm	other	1.040
CPXM2	carboxypeptidase X (M14 family), member 2	Extracellular Space	peptidase	1.030
CREB3L4	cAMP responsive element binding protein 3-like 4	Nucleus	transcription regulator	1.054
CTDSP1	CTD (carboxy-terminal domain, RNA polymerase II, polypeptide A) small phosphatase 1	Nucleus	phosphatase	1.119
DCLK1	doublecortin-like kinase 1	Plasma Membrane	kinase	0.939
DLG2	discs, large homolog 2 (<i>Drosophila</i>)	Plasma Membrane	kinase	0.917
DNAH6	dynein, axonemal, heavy chain 6	unknown	other	0.957
DYNC2L1	dynein, cytoplasmic 2, light intermediate chain 1	Cytoplasm	other	0.946
DZIP3	DAZ interacting protein 3, zinc finger	Cytoplasm	enzyme	0.905
ELAVL4	ELAV (embryonic lethal, abnormal vision, <i>Drosophila</i>)-like 4 (Hu antigen D)	Cytoplasm	other	0.931
FAM155A	family with sequence similarity 155, member A	unknown	other	0.860
FAM64A	family with sequence similarity 64, member A	Nucleus	other	1.154
FAT3	FAT tumor suppressor homolog 3 (<i>Drosophila</i>)	unknown	other	0.954
FJX1	four jointed box 1 (<i>Drosophila</i>)	Extracellular Space	other	1.104
FN3K	fructosamine 3 kinase	Cytoplasm	kinase	1.269
GABBR2	gamma-aminobutyric acid (GABA) B receptor, 2	Plasma Membrane	G-protein coupled receptor	0.862
GALNT10	UDP-N-acetyl-alpha-D-galactosamine: polypeptide N-acetylgalactosaminyltransferase 10 (GalNAc-T10)	Cytoplasm	enzyme	1.064
GLI2	GLI family zinc finger 2	Nucleus	transcription regulator	1.033
GLRA1	glycine receptor, alpha 1	Plasma Membrane	ion channel	1.043
GPR176	G protein-coupled receptor 176	Plasma Membrane	G-protein coupled receptor	1.098
GSG1L	GSG1-like	unknown	other	1.025
HHIPL1	HHIP-like 1	unknown	other	1.063
HOXD10	homeobox D10	Nucleus	transcription regulator	1.038
HYDIN	HYDIN, axonemal central pair apparatus protein	unknown	other	1.090
IRX4	iroquois homeobox 4	Nucleus	transcription regulator	1.032
KLF2	Kruppel-like factor 2 (lung)	Nucleus	transcription regulator	1.103
KRTAP9-2	keratin associated protein 9-2	unknown	other	1.022
MBD3L2 (includes others)	methyl-CpG binding domain protein 3-like 2	unknown	other	1.025
MCTP1	multiple C2 domains, transmembrane 1	unknown	other	0.914
MFAPS5	microfibrillar associated protein 5	Extracellular Space	other	1.026
MMP16	matrix metallopeptidase 16 (membrane-inserted)	Extracellular Space	peptidase	0.928
PEX5L	peroxisomal biogenesis factor 5-like	Cytoplasm	ion channel	0.932
PHLDA3	pleckstrin homology-like domain, family A, member 3	Plasma Membrane	other	1.067
POU4F2	POU class 4 homeobox 2	Nucleus	transcription regulator	1.034
PYCR1	pyrrolidine-5-carboxylate reductase 1	Cytoplasm	enzyme	1.048
RND3	Rho family GTPase 3	Cytoplasm	enzyme	1.026
RNF128	ring finger protein 128, E3 ubiquitin protein ligase	Cytoplasm	enzyme	0.952
RUNX1T1	runt-related transcription factor 1; translocated to, 1 (cyclin D-related)	Nucleus	transcription regulator	1.055
SLITRK1	SLIT and NTRK-like family, member 1	unknown	other	0.917
SLITRK1	SLIT and NTRK-like family, member 1	unknown	other	0.948
SORBS2	sorbin and SH3 domain containing 2	Plasma Membrane	other	0.961
STAG3L1	stromal antigen 3-like 1	unknown	other	1.088
STARD13	StAR-related lipid transfer (START) domain containing 13	Cytoplasm	other	1.221
STX1B	syntaxin 1B	Plasma Membrane	ion channel	0.915
TGM4	transglutaminase 4 (prostate)	Extracellular Space	enzyme	1.086
TMEM56	transmembrane protein 56	unknown	other	0.947
WFDC11	WAP four-disulfide core domain 11	Extracellular Space	other	1.030
YPEL1	yippee-like 1 (<i>Drosophila</i>)	Nucleus	enzyme	0.934

The invention will now be further understood with reference to the following non-limiting examples.

EXAMPLES

Example 1

Gene Expression Microarray Analysis of Brain Samples from Alzheimer'S Disease Patients

1.1 Patients and Biomaterials

Human brain tissue collected by the Oxford Project to Investigate Memory and Aging (OPTIMA) was made available through the Thomas Willis brain bank. In total, samples from 252 brains were available from a mix of elderly controls and patients suffer from preclinical, mild and severe AD at the time of death (as determined by Braak staging). The number of cases included in the study was based on availability, not statistical power calculations, as the outcome, and hence number of patients in each group-of-interest, was unknown. The tissue was snap frozen at the time of autopsy; and available from the lateral temporal lobe (severely affected by AD pathology), frontal lobe (affected by AD pathology) and occipital lobe (largely unaffected by AD pathology). A wealth of clinical information was available about each patient, including: Braak stage (severity of AD); additional pathology; age of onset and age at death; personal and family history of cancer; plasma homocysteine levels, and the results of annual clinical tests including test of cognitive performance (CAMCOG).

1.2 DNA, RNA and Protein Extraction

RNA, DNA and protein were isolated from lateral temporal, frontal and occipital lobe tissue of each patient by TRI-reagent extraction. 100 mg of frozen tissue was homogenised in 1 ml TRI-reagent, incubated at room temperature (RT) for 5 minutes, and supplemented with 100 µl 1-bromo-3-chloropropane. The solution was vigorously mixed for 15 seconds, incubated for 2 minutes, and centrifuged at 12,000 rotational centrifugal force (g) for 15 minutes at 4° C. to separate the RNA, DNA and protein layers.

The aqueous RNA layer was transferred to an eppendorf, supplemented with 500 µl isopropanol and mixed gently by inversion. After five minute incubation, the solution was centrifuged at 12,000 g for 8 minutes at 4° C. The pellet was washed in 1 ml 75% ethanol, centrifuged at 7,500 g for 5 minutes at 4° C., and ethanol wash removed. The pellet was air-dried for 30 minutes and rehydrated in 100 µl nuclease free water by incubation at 55° C. for 15 minutes, prior to storage at -80° C.

RNA was converted to cDNA by reverse transcription: 50 µl of 200 ng/µl RNA was added to 50 µl of Reverse Transcriptase master mix (composed of 10 µl 10x reverse transcriptase buffer; 4 µl dNTP mix (100 mM); 10 µl random primers; 5 µl MultiScribe Reverse Transcriptase (50 U/µl); and 21 µl nuclease free water), and incubated at 25° C. for 10 minutes; 37° C. for 120 minutes and 85° C. for 5 seconds in a Thermal cycler. The cDNA was precipitated with isopropanol (100 µl cDNA supplemented with 20 µl of 3M sodium citrate at pH 5 and 400 µl isopropanol), centrifuged at high speed for 10 minutes, and the resulting pellet washed in ice cold 100% ethanol. Following high speed centrifugation and supernatant removal, the pellet was air dried overnight, and rehydrated in 100 µl nuclease free water, prior to storage at 4° C.

The remaining TRI-reagent layers were supplemented with 300 µl ethanol and centrifuged at 12,000 g for 5 minutes

at 4° C. to produce the DNA pellet. The pink supernatant was transferred to a clean eppendorf in preparation for protein extraction. The DNA pellet was washed three times, 1 hour per wash, in 0.1M sodium citrate in 10% ethanol, with centrifugation at 12,000 g for 5 minutes between washes. Following a 30 minute wash in 75% ethanol, the pellet was centrifuged at 2,000 g for 5 minutes to allow wash removal, and the pellet air dried overnight. The pellet was dissolved in nuclease free water for 24 hours, centrifuged at 16,000 g for 10 minutes, and supernatant transferred to a clean tube to separate DNA from any insoluble material. The DNA was stored at 4° C.

The protein was precipitated from the pink layer by 15 minute incubation with 3 volumes acetone prior to centrifugation at 12,000 g for 10 min at 4° C. The protein pellet was subjected to three 10 minute washes in 0.3M guanidine hydrochloride in 95% ethanol and 2.5% glycerol, and dissolved in radio-immunoprecipitation (RIPA) buffer (composition: 0.1 M sodium chloride, 0.01 M Tris hydrochloride, 1:500 EDTA, 400 ug/ml phenylmethanesulfonylfluoride, 2 ug/ml aprotinin and 1% sodium dodecyl sulphate). The protein was stored at -20° C.

1.3 One-colour Custom Microarray Based Gene Expression Analysis (Agilent)

8×15K Custom Microarrays (Agilent Technologies: able to accommodate up to 15,000 genes) were designed to include various housekeeping genes (719 genes), internal controls (3141 genes), and genes that were differentially expressed in AD brain relative to control brain based on a published dataset (Xu, P. T. et al. Differences in apolipoprotein E3/3 and E4/4 allele-specific gene expression in hippocampus in Alzheimer disease. *Neurobiol. Dis.* 21, 256-275 (2006); Xu, P. T. et al. A SAGE study of apolipoprotein E3/3, E3/4 and E4/4 allele-specific gene expression in hippocampus in Alzheimer disease. *Mol. Cell Neurosci.* 36, 313-331 (2007) (3718 genes). The remaining 7422 spaces were filled with known rapamycin-regulated genes (based on an IPA Ingenuity search) and the genes that were identified as rapamycin-regulated in lymphocytes based on two-colour microarray based gene expression analysis.

Of the 252 patients for whom tissue was available through the Thomas Willis brain bank, 32 patients were selected for one-colour custom microarray based gene expression analysis. They included control subjects and patients with mild and advanced AD. The exclusion criteria were as follows: vascular disease; Parkinson's disease; ApoE ε2/ε2, ApoE ε2/ε3 and ApoE ε4/ε4 genotypes (not enough patients for meaningful statistical analysis); and high plasma homocysteine level (>35 µM).

1.3.1 Sample Preparation

RNA was extracted from the frontal lobe of each subject by TRI-reagent protocol as described in 1.2. The RNA was treated with DNase. The suitability of the RNA for microarray based gene expression analysis was determined by Agilent RNA nano-chip analysis. RIN values ranged from 2-3 indicating relatively poor quality RNA. However, this was unavoidable, as the source brain tissue had significant post-mortem time prior to freezing, resulting in inevitable degradation.

1.3.2 Conversion of RNA to labelled cRNA

200 ng of RNA was converted to cDNA, and subsequently to labelled cRNA, with the low-input quick amplification labelling kit. The spike mix was incubated at 37° C. for 5 minutes, and diluted in the provided dilution buffer (Agilent Technologies) as shown in Table 6. 2 µl of the diluted spike mix was added to the RNA (200 ng) in a 1.5 µl volume.

Cyanine 3-CTP was used to label all samples. The labelled and amplified cRNA samples were purified by standard Qiagen RNeasy mini column protocol, and quality assessed and quantified.

TABLE 6

Preparation of Spike Mix						
			Spike mix volume			
Total RNA (ng)	Concentration (ng/ μ l)	Serial dilutions				per labelling (μ l)
(ng)	(ng/ μ l)	First	Second	Third	Fourth	(μ l)
200	133.3	1:20	1:25	1:10	2	

1.3.3 Hybridisation

600 ng of labelled cRNA was added to various fragmentation components (Table 7), incubated at 60° C. for 30 minutes, and cooled on ice for 1 min. 25 μ l of GEx Hybridisation buffer HI-RPM was added to stop fragmentation. The sample was gently mixed, centrifuged at 13,000 rpm for 1 min, and placed on ice in preparation for hybridisation. The microarray was assembled and incubated overnight: the Custom 8 \times 15K Microarray was used and 40 μ l of sample was added per 15K array. After 17 hour hybridisation, the microarrays were washed and scanned on the Agilent C Scanner on programme AgilentHD_GX_1 color, with the settings amended as shown in Table 8.

TABLE 7

Fragmentation components	
Components (Agilent)	Volume/Mass (for 8 \times 15K microarray)
Cy3-labelled cRNA	600 ng
10 x blocking agent	5 μ l
Nuclease free water	Bring total volume to 24 μ l
25 x fragmentation buffer	1 μ l
Total volume	25 μ l

1.3.4. Data Analysis

The feature extraction programme was used to collate the Custom Microarray layout with the output of the scanner. The results from individual patients were grouped based on subject diagnosis, disease severity (as defined by Braak stage) and ApoE genotype. For the purposes of this study, the groups-of-interest were as follows (see Table 9):

TABLE 9

Patient diagnosis	ApoE genotype	Number of patients
Control (entorhinal stage)	ApoE ϵ 3/ ϵ 3	5
Mild AD (limbic stage)	ApoE ϵ 3/ ϵ 3	5
Advanced AD (neocortical stage)	ApoE ϵ 3/ ϵ 3	4
Advanced AD (neocortical stage)	ApoE ϵ 3/ ϵ 4	18

Statistical Analysis of Microarray (SAM) was used to carry out unpaired, two-sample T tests for each gene in a group-of-interest compared to control. SAM identifies genes that are differentially expressed at RNA level in the group-of-interest compared to control group; the direction of expression; fold change; and an estimate of the false discovery rate (FDR). For the purpose of our study, we selected an estimated FDR of 10% as acceptable for identifying differentially expressed genes. SAM was carried out with 1000 permutations, and the output processed to remove duplicates. The output was analysed with the IPA Ingenuity software (www.ingenuity.com).

Tables 2 shows differentially expressed transcripts in brain from early AD patients (limbic stage) relative to control (entorhinal stage). Table 3 shows differentially expressed transcripts in brain from advanced AD patients (neocortical stage) relative to control (entorhinal stage).

Example 2

Q-PCR Validation of Microarray Results

Real-time PCR (Q-PCR) allows relative quantification of a gene-of-interest by calculating the expression of the gene relative to a housekeeping gene such as beta-actin, allowing patient to patient comparison. The validation study was carried out on cDNA obtained from the same patients and brain regions that were used for the microarray study. The genes were selected as they were shown to be either significantly up- or down-regulated in advanced AD (neocortical stage) compared to control in the microarray study. The Universal probe library design centre (Roche Diagnostic Website) was used to design Q-PCR systems for the genes (see Table 10); and primers and probes ordered from Sigma Genosys and Roche respectively.

TABLE 10

Gene	Roche probe, primer sequences, and optimal annealing temperature corresponding to each gene-of-interest		
	Forward Roche primer Probe (5'-3')	Backward primer (5'-3')	Optimal annealing temperature (° C.)
Beta actin	24 TCAGCTGTGGGTC CTGT (SEQ ID NO: 1)	GAAGGGACAGGCAG TGAG (SEQ ID NO: 2)	62
EIF4E (Variant 1 and 2)	35 GATGGCGACTGTCG AACC (SEQ ID NO: 3)	TGGGTTAGCAACCTC CTGAT (SEQ ID NO: 4)	60
EIF4E (Variant 3)	35 GTGTAGCGCACACT TTCTGG (SEQ ID NO: 5)	TGGGTTAGCAACCTC CTGAT (SEQ ID NO: 6)	60

35

For the composition of each 20 µl Q-PCR mix see Table 11. Two negative controls (water) and a cDNA standard curve (five serial dilutions starting with neat cDNA) were included per Q-PCR run. The samples were denatured at 96° C. for 15 minutes and amplified by 40 cycles of 96° C. for 15 seconds, optimal annealing temperature (Table 10) for 30 seconds and 72° C. for 30 seconds. FAM output was read in the annealing phase.

TABLE 11

Composition of Q-PCR reaction	Manufacturer
0.5 µl Universal probe (10 µM)	Roche
10 µl Absolute Q-PCR mix	ThermoScientific
(Composition: 0.625 Units ThermoPrime Taq DNA polymerase, 75 mM Tris HCl (pH 8.8 at 25° C.), 20 mM (NH ₄) ₂ SO ₄ , 1.5 mM MgCl ₂ , 0.01% (v/v) tween 20, 0.2 mM each of dATP, dCTP, dGTP, dTTP).	
0.5 µl forward primer (20 µM)	Sigma Genosys
0.5 µl backward primer (20 µM)	Sigma Genosys
6.5 µl nuclease free water	Qiagen
2 µl cDNA (neat, 1:4 and 1:16)	Prepared as above

2.1 Data Analysis

Each of the cDNA standard curve serial dilutions were assigned an arbitrary copy number (1:1=10,000; 1:2=5,000; 1:4=2500; 1:8=1250; 1:16=625). The Rotor gene-6 programme automatically identifies the optimal threshold and determines the copy number of the gene-of-interest relative to the standard curve for each sample. The Q-PCR was considered fully optimised when the calculated standard

curve copy number varied less than 10% from the assigned copy number. The values obtained for each gene were normalised to the corresponding beta-actin values to allow quantitative comparison of samples.

40

Example 2

Modulation of Rapamycin-sensitive Genes has the Same Beneficial Effect on Alzheimer's Disease-related Protein Expression as Rapamycin

2.1 Methods

The genes identified as rapamycin-sensitive genes (existing Table 1) were used for computer based (*in silico*) molecular network modelling and analysis (using the IPA molecular network tools). In *silico* simulation of molecular interactions in the AD brain was also carried out based on the expression pattern of the rapamycin-sensitive genes shown in Table 2. Selected rapamycin-sensitive genes were used for further simulations to predict the effect of silencing these rapamycin-sensitive genes on AD-related pathology.

The simulations were followed by experiments to verify whether the modulation of the downstream effectors of mTOR (rapamycin-sensitive genes) would lead to measurable changes in MAPT (microtubule associated protein tau) similar to rapamycin.

In the cellular models used, the mTOR activation is achieved by growth factors in the serum. The inhibition of mTOR by the addition of rapamycin counteracts this effect and reduces the production of AD-type phospho-tau in the cultures.

Cell Culture

SH-SY5Y human neuroblastoma cells were purchased from ECACC and cultured in DMEM/F-12 (Sigma) supplemented with 10% FCS Gold (PAA), 100 U penicillin-streptomycin (Invitrogen) and 2 mM L-glutamine (Sigma). Cells were kept in a humidified atmosphere at 37°C. and 5% CO₂. Cells were seeded in 96-well plates and cultured for 24 hours before siRNA treatment.

siRNA Treatment of SH-SY5Y Cells

siRNA was purchased from Origene and applied at 1 nM concentration for 48 hours. siRNA duplexes (Origene) were supplied as 20 µM stock solutions. siRNA was diluted in OPTIMEM to a 300 nM concentration and incubated at room temperature (RT) for 10 min. Lipofectamine (RNAiMAX) was also diluted in OPTIMEM and incubated at RT for 10 min. The lipofectamine mix and the duplex mix were added to the culture medium (antibiotic free) to achieve the final concentration of 1 nM siRNA and 0.3% lipofectamine. Cells were incubated at 37°C. for 4 hours, and then media was replaced with antibiotic free media until collection. Some cultures were treated with additional rapamycin for the last 24 hours of the culture period.

Immunostaining

Cells were sequentially fixed in Glyo-Fixx (Thermo Scientific) for 2 hours at RT and in 85% cold ethanol for 30 min. Blocking (of non-specific staining) was performed for 30 min at RT using 5% BSA and 0.1% Triton-X-100 in PBS. Cells were incubated with primary antibody overnight at 4°C. (for the negative controls, cells were incubated with PBS-Triton only). Cells were washed in PBS-0.1% Triton and incubated with secondary antibody (FITC conjugated) for 2 hours at 4°C. Cells were washed in PBS-0.1% Triton and propidium iodide counterstained. The antibodies used were mouse polyclonal to phospho-Tau (Abcam, 1:200) and anti-mouse IgG-FITC (Abcam, 1:400).

Propidium Iodide Staining

Cells were incubated with propidium iodide (Invitrogen, 10 µg/ml) supplemented with RNaseA (Sigma, 100 µg/ml) for 20 min at 37°C. and scanned.

Cytometry

Cytometry was performed using the Acumen Explorer TTP Lab Tech, Ltd. (Software version 3.1.12).

The propidium iodide staining was used to determine the cell cycle phase of the cells based on DNA content. It was measured using a 488 nm excitation laser triggering the 3° channel (bandpass filter 585-620 nm).

The immunostaining was used to measure the content of phospho-Tau in the cells. Measurement was carried out using a laser triggering the 1° channel (bandpass filter 500-530 nm).

Cell Cycle Analysis

To determine cut-offs for cells in different phases of the cell cycle, gate setting was performed based on the G1 and G2 peaks on the DNA content histogram. To determine the G1 and G2 peaks, the 3° total intensity in 20% histograms was analysed for each plate. Gates calculated were manually entered into the Acumen software.

The data exported and quantified included separately all cells and single cells. Single cells were further subcategorised into euploid, apoptotic and polyploid cells. Euploid cells were additionally classified into cells in G1S and G2M phases of the cell cycle.

Cellular Protein Measurement

The total fluorescence intensity from the 1° channel was used to compare total protein levels in the different cell populations defined above. Mean fluorescence intensity per cell (for the whole of the population) and mean fluorescence

intensity per cell (for positive cells only) were analysed separately. Additionally the proportion of positive cells in each population was calculated.

2.2 Results**2.2.1 The Effects of Rapamycin**

The in silico simulations (using the IPA molecular network modelling tool) indicated that the rapamycin regulated molecules interact with the AD-related proteins APP (amyloid precursor protein) and the microtubule associated protein tau (MAPT). The in silico analysis indicated that the activation of mTOR in normal circumstances would lead to the inhibition of MAPT and APP.

The gene expression patterns of rapamycin-sensitive genes in early stage AD patients (as shown in existing Table 2) were used to predict the activation state of APP and MAPT in the brain. Based on the expression pattern of rapamycin-sensitive genes in the early (limbic) stage of AD, the inhibition of MAPT and APP was predicted. The in silico simulation also predicted that this gene expression pattern is associated with the activation of mTOR. However, the expression pattern of many rapamycin-sensitive genes in the brain of AD patients is inconsistent with the known normal molecular interactions. This indicates that the AD-related deregulation of the mTOR pathway is also associated with unexpected variations from normal molecular interactions that are compatible with the idea that these molecules have variants (SNPs or other genetic variations) that interfere with their normal interactions.

The simulated inhibition of mTOR in this system (using rapamycin) will reverse the AD-associated inhibition of MAPT and APP, indicating that rapamycin could reverse the molecular expression changes seen in AD.

In the experimental paradigm mTOR is activated in the neuronal cells (in the presence of growth factors from the serum). The addition of rapamycin (100 ng/ml) will inhibit mTOR, leading to the down regulation of AD-related phospho-tau (p-tau) in the cells.

In the SH-SY5Y cellular model, p-tau expression was regulated in a cell-cycle dependent manner and protein content of cells was generally higher in the cells that were in the G2 phase of the cell cycle relative to cells in the G1 phase of the cell cycle (FIG. 1: White bars represent the G1 phase cell population; black bars represent the G2 phase population).

The effects of mTOR inhibition by rapamycin had the following effects. Firstly, the cell cycle kinetics were altered such that the G1 phase became longer and the G2 phase was shortened, as reflected by the accumulation of cells in the G1 phase of the cell cycle at the expense of the G2 phase (FIG. 2: Vertically shaded bars represent the G1 population; the horizontally shaded bars represent the G2 cell population. Lighter shades represent cells treated with Culture medium alone. Darker shades represent cells treated with Culture medium containing 100 ng/ml rapamycin. All data is normalised to Control (100%)). Secondly, the rapamycin induced a reduction of p-tau content in the whole cell culture. This is partly due to the alterations in cell cycle kinetics (reduction of the G2 cell population with the generally higher p-tau content). However, the rapamycin also had a cell cycle independent effect on p-tau leading to further reductions in this protein (FIG. 3: Grey bars represent all single cells; Vertically shaded bars represent the G1 population; the horizontally shaded bars represent the G2 cell population. Lighter shades represent cells treated with Culture medium alone. Darker shades represent cells treated with Culture medium containing 100 ng/ml rapamycin. All data are normalised to Control (100%)).

These findings indicate, in accordance with previous studies, that rapamycin is able to modulate the accumulation of AD-type p-tau both in a cell cycle dependent and independent manner.

The possibility that modulation of downstream effectors of mTOR (shown in Table 1) would have a similar effect to that observed with rapamycin was subsequently investigated.

2.2.2 CACNA1 D

CACNA1D was not previously known to be a rapamycin-sensitive gene. Subsequently, the in silico molecular simulation of CACNA1 D knockdown did not predict alteration in the expression of MAPT or APP.

However, the experimental data showed that the cell cycle effects of CACNA1 D knock-down by siRNA were similar to that of rapamycin (FIG. 4: Vertically shaded bars represent the cell population in the G1 phase of the cell cycle, and the G1 time; horizontally shaded bars represent the cells in the G2 phase of the cell cycle and the G2 time. Lighter shades represent cells treated with Culture medium, siRNA control and CACNA1 D siRNA alone. Darker shades represent cells treated with an additional 100 ng/ml rapamycin. All data is normalised to Control (100%)). The effect of CACNA1 D knock-down by siRNA did not alter the effect of rapamycin. This is consistent with the cell cycle modulator effect of CACNA1 D downstream of mTOR.

Protein expression analysis indicated that the effect of CACNA1 D knockdown is similar to that induced by rapamycin. However, the CACNA1 D knockdown did not alter the effect of rapamycin on p-tau expression in cells (FIG. 5: Grey bars represent all single cells; Vertically shaded bars represent the cell population in the G1 phase of the cell cycle; horizontally shaded bars represent the cells in the G2 phase of the cell cycle. Lighter shades represent cells treated with Culture medium, siRNA Control and CACNA1 D siRNA alone. Darker shades represent cells treated with additional 100 ng/ml rapamycin. All data are normalised to Control (100%)).

The data provide evidence that, contrary to prior knowledge, the CACNA1 D gene expression is mTOR dependent. The data also provide evidence that modulation of CACNA1 D has a similar effect to rapamycin in terms of cell cycle and AD-related p-tau expression.

The data provide evidence that the modulation of a downstream effector of mTOR has the same beneficial effect on AD-related cell cycle and protein changes as rapamycin.

2.2.3 GABBR2

The GABBR2 receptor has not previously been identified as a downstream effector of mTOR i.e. is not a known rapamycin-sensitive gene. Thus the in silico simulation of GABBR2 receptor knockdown did not predict a similar effect to rapamycin with respect to AD-related protein expression.

However, the effects of GABBR2 knockdown by siRNA in the experimental model were similar to that of rapamycin. The GABBR2 knockdown did not affect the rapamycin response significantly (FIG. 6: Vertically shaded bars represent the cell population in the G1 phase of the cell cycle, and the G1 time; horizontally shaded bars represent the cells in the G2 phase of the cell cycle and the G2 time. Lighter shades represent cells treated with Culture medium, siRNA Control and GABBR2 siRNA alone. Darker shades represent cells treated with additional 100 ng/ml rapamycin. All data is normalised to Control (100%)). These data are consistent with the cell cycle modulator effect of GABBR2 downstream of mTOR.

The effect of GABBR2 knockdown on p-tau expression was similar to that induced by rapamycin, albeit weaker. However, in the presence of rapamycin, GABBR2 knockdown had no further significant effect on p-tau expression in cells (FIG. 7: Grey bars represent all single cells; vertically shaded bars represent the cell population in the G1 phase of the cell cycle; horizontally shaded bars represent the cells in the G2 phase of the cell cycle. Lighter shades represent cells treated with Culture medium, siRNA Control and GABBR2 siRNA alone. Darker shades represent cells treated with additional 100 ng/ml rapamycin. All data are normalised to Control (100%)).

The data provide evidence that, contrary to prior knowledge, the GABBR2 gene expression is mTOR dependent. The data also provide evidence that modulation of GABBR2 has a similar effect to rapamycin in terms of cell cycle and AD-related p-tau expression.

The data provides evidence that the modulation of a downstream effector of mTOR has the same beneficial effect on AD-related cell cycle and protein changes as rapamycin.

2.2.4 HOXD10

The HOXD10 gene was not previously known to be rapamycin-sensitive. Thus the in silico simulation of HOXD10 knockdown did not predict a similar effect to rapamycin with respect to AD-related protein expression.

In the experimental model, the siRNA to HOX10D did not affect the cell cycle in a similar fashion to rapamycin (FIG. 8: Vertically shaded bars represent the cell population in the G1 phase of the cell cycle, and the G1 time; horizontally shaded bars represent the cells in the G2 phase of the cell cycle and the G2 time. Lighter shades represent cells treated with Culture medium, siRNA Control and HOX10D siRNA alone. Darker shades represent cells treated with additional 100 ng/ml rapamycin. All data are normalised to Control (100%)). However, rapamycin was able to exert its cell cycle modulator effect even when HOX10D was not expressed (FIG. 8). This would indicate that HOX10D does not play a role in the rapamycin induced cell cycle modulation.

HOX10D knockdown had a weak effect in reducing p-tau expression in the cellular model, mainly by reducing the amount of p-tau in the G1 cell population. The effects were significantly weaker than that of rapamycin and the HOXD10 knockdown did not affect the rapamycin effect (FIG. 9: Grey bars represent all single cells; Vertically shaded bars represent the cell population in the G1 phase of the cell cycle; horizontally shaded bars represent the cells in the G2 phase of the cell cycle. Lighter shades represent cells treated with Culture medium, siRNA Control and HOX10D siRNA alone. Darker shades represent cells treated with additional 100 ng/ml rapamycin. All data are normalised to Control (100%)). The data provide evidence that the modulation of a downstream effector of mTOR has the same beneficial effect on AD-related protein changes as rapamycin.

2.2.5 KLF2

Although KLF2 was not previously identified as a rapamycin-sensitive gene, the indirect molecular interactions allowed the simulation of the effect of mTOR on KLF2. However, in AD the expression of KLF2 was found to be opposite to what would normally be expected in response to mTOR activation. The effects of KLF2 knockdown in the AD brain were simulated, and found to closely mimic the effects of rapamycin in terms of AD-related protein expression (MAPT and APP).

In the experimental model, the knockdown of KLF2 produced similar but weaker cell cycle effects relative to rapamycin. The KLF2 knockdown did not affect signifi-

cantly the effect of rapamycin on the G1 phase of the cell cycle. However, the KLF2 knockdown led to a significant alteration of the G2 effect of rapamycin (FIG. 10: Vertically shaded bars represent the cell population in the G1 phase of the cell cycle, and the G1 time; horizontally shaded bars represent the cells in the G2 phase of the cell cycle and the G2 time. Lighter shades represent cells treated with Culture medium, siRNA Control and KLF2 siRNA alone. Darker shades represent cells treated with additional 100 ng/ml rapamycin. All data are normalised to Control (100%)). The data indicate that KLF2 is a downstream effector of the mTOR induced cell cycle response and it is essential for the G2 regulator effects of mTOR.

The effects of KLF2 knockdown on p-tau expression were similar to those of rapamycin, albeit a lot weaker. The KLF2 knockdown did not affect the rapamycin effect on p-tau expression (FIG. 11: Grey bars represent all single cells; Vertically shaded bars represent the cell population in the G1 phase of the cell cycle; horizontally shaded bars represent the cells in the G2 phase of the cell cycle. Lighter shades represent cells treated with Culture medium, siRNA Control and KLF2 siRNA alone. Darker shades represent cells treated with additional 100 ng/ml rapamycin. All data are normalised to Control (100%)).

These data also indicate that the modulation of a rapamycin-sensitive gene will lead to effects that are similar to rapamycin.

2.2.6 RHO

RHO was not previously known to be a rapamycin-sensitive gene. However, the molecular interactions of RHO allowed the simulation of the effect of RHO knockdown in the AD brain. The in silico simulation indicated that RHO knockdown will lead to changes in the AD-related molecules (MAPT and APP) similar to that seen with Rapamycin.

In the experimental model the knockdown of RHO produced similar, but weaker cell cycle effects relative to rapamycin. The RHO knockdown did not affect significantly the effect of rapamycin on the G1 phase of the cell cycle. However, the RHO knockdown led to a significant alteration of the G2 effect of rapamycin (FIG. 12: Vertically shaded bars represent the cell population in the G1 phase of the cell cycle, and the G1 time; horizontally shaded bars represent the cells in the G2 phase of the cell cycle and the G2 time. Lighter shades represent cells treated with Culture medium, siRNA Control and RHO siRNA alone. Darker shades represent cells treated with additional 100 ng/ml rapamycin. All data are normalised to Control (100%)). The data indicate that RHO is a downstream effector of the mTOR induced cell cycle response and it is essential for the G2 regulator effects of mTOR.

The effects of RHO knockdown on p-tau expression were similar to those of rapamycin, albeit a lot weaker. The RHO knockdown did not affect the rapamycin effect on p-tau expression (FIG. 13: Grey bars represent all single cells; Vertically shaded bars represent the cell population in the G1 phase of the cell cycle; horizontally shaded bars represent the cells in the G2 phase of the cell cycle. Lighter shades represent cells treated with Culture medium, siRNA Control and RHO siRNA alone. Darker shades represent cells treated with additional 100 ng/ml rapamycin. All data are normalised to Control (100%)). These data are consistent with RHO acting downstream of mTOR.

The data also indicate that the modulation of a rapamycin-sensitive gene will lead to effects that are similar to rapamycin.

2.2.7 GLI2

Based on known molecular interactions it could be predicted in silico that GLI2 (although not previously identified as a rapamycin-sensitive gene) would be differentially regulated by mTOR activation. The AD brain expression studies however indicated that the expression of GLI2 is not consistent with the activation of mTOR. The in silico simulations carried out to predict the effects of GLI2 knockdown in the AD brain indicated that the knockdown of GLI2 would lead to effects that are very similar to that of rapamycin in terms of AD-related protein (MAPT and APP) expression in the brain.

The effects of GLI2 knockdown by siRNA on the cell cycle were similar to that of rapamycin, but had no effect on rapamycin response (FIG. 14: Vertically shaded bars represent the cell population in the G1 phase of the cell cycle, and the G1 time; horizontally shaded bars represent the cells in the G2 phase of the cell cycle and the G2 time. Lighter shades represent cells treated with Culture medium, siRNA Control and GLI2 siRNA alone. Darker shades represent cells treated with additional 100 ng/ml rapamycin. All data are normalised to Control (100%)).

The data indicate that in the absence of rapamycin the effect of GLI2 knockdown is similar to that induced by rapamycin, albeit weaker (FIG. 15: Grey bars represent all single cells; Vertically shaded bars represent the cell population in the G1 phase of the cell cycle; horizontally shaded bars represent the cells in the G2 phase of the cell cycle. Lighter shades represent cells treated with Culture medium, siRNA Control and GLI2 siRNA alone. Darker shades represent cells treated with additional 100 ng/ml rapamycin. All data are normalised to Control (100%)). However, in the presence of rapamycin GLI2 knockdown had no further significant effect on p-tau expression in cells.

The data provide evidence that modulation of GLI2 has a similar effect to rapamycin in terms of cell cycle and AD-related p-tau expression.

In summary, the modulation of individual rapamycin-sensitive genes can achieve the same beneficial effect on neurones as rapamycin.

Example 3

Modulation of mTOR Activity can be Detected by Imaging Metabolic Markers Associated with Rapamycin-sensitive Genes

3.1 MRI

To analyse the effect of mTOR activation and inhibition on the brain, SD rats (170-220 g) were treated with rapamycin (inhibitor of mTOR; 0.2 mg/kg i.p.) and ketamine (activator of mTOR; 30 mg/kg i.p) and neuroimaging results from these experiments were compared to control (untreated) animals. There were three animals (n=3) in each group. Animals were sacrificed and the brain removed and frozen for imaging studies.

Whole organs were fixed in 0.154 M LiCl in 10:1 H₂O: formaldehyde prior to MRI experiments. All imaging experiments were performed on a Bruker DMX300 spectrometer, at a ¹H NMR resonance frequency of 300 MHz at 289.5±0.2 K. All images were acquired using a 30 mm radiofrequency resonator. Images were acquired using a spin-echo imaging technique [1]. A set of either 7 or 8 equally spaced, coronal slices of 1 mm thickness, with a matrix size of 128×32 pixels and field-of-view of 30 mm×10 mm, were collected along the length of the brain. The recovery time was 15 s, to ensure full T1 relaxation between

each acquisition. A T_2 map, for each coronal slice, was produced by acquiring between 16 and 24 echo images and varying the echo time from a minimum value of 3 ms to a maximum value of 80 ms. These echo images were then fitted to Equation 1, resulting in a T_2 value for each pixel in the coronal slice.

$$M_x = M_0 e^{\frac{-t}{T_2}} \quad (1)$$

where M_x is the signal intensity for each pixel at time t and M_0 is the signal intensity at $t=0$.

A transverse T_2 map was acquired for each brain using the method described for the coronal maps. Each image comprised 128×128 pixel array, with a field of view of 3 cm×3 cm. A total of 24 echo images were acquired for each transverse T_2 map, with echo times from 3-80 ms. Each transverse slice was positioned in the centre of the brain.

FIGS. 16A-C show clear differences in the T_2 weighted MRI images obtained from Rapamycin treated, ketamine treated and Control animals.

3.2 Magnetic Resonance Spectroscopy Imaging

In silico simulations of the effects of mTOR activation and inhibition on the accumulation of choline and creatine have been carried out. These simulations indicated that mTOR modulation leads to significant changes in choline and creatine levels. This is consistent with the possibility of imaging mTOR activation/inhibition in the brain using magnetic spectroscopy.

Methods

All MSI imaging experiments were performed on a Bruker ultraflexXtreme TOF/TOF mass spectrometer. For matrix evaluation, 4 serial sections of thickness 10 μm from sham control brain S2 were acquired using a Leica CM 1850 Cryostat and subsequently thaw mounted onto an ITO coated glass slide. Each section in turn was coated with 15 mL of 20 mg mL⁻¹ of CHCA in CH₃OH, 0.1% TFA) using an artist airbrush while the remaining 2 sections were covered. Data were collected over the mass range m/z 60-1400. MSI experiments of a single section from each group (Rapa, Ket and Control) were conducted. Data were collected over the mass range m/z 60-1400. Images were acquired with a pixel size of 100 $\mu\text{m} \times 100 \mu\text{m}$.

The data set contains numerous ion images which demonstrate grey and white anatomical differences and clear differences induced by mTOR inhibition or activation (by rapamycin and ketamine respectively relative to control). These molecular species belong to the group of Phosphatidylcholines (FIG. 17. First row Rapamycin treated; Second row—Ketamine treated; Third row—Control. Columns: 1) m/z 769, 2) m/z 868, 3) m/z 866, 4) m/z 752, 5) m/z 844, 6) m/z 840, 7) m/z 780).

Additionally there is evidence that, similar to the simulated models, mTOR modulation (by rapamycin or Ketamine) leads to measurable changes of choline (FIG. 18A. First row—Rapamycin treated, Second row—Ketamine treated, Third row—Control) and creatine (FIG. 18B. First row—Rapamycin treated, Second row—Ketamine treated, Third row—Control) levels in the brain.

The clear differences in the MRI imaging as well as the differences in the magnetic spectroscopy indicate that changes in brain metabolism induced by mTOR inhibition or activation can clearly be identified using methods already used in human imaging technology.

Example 4

The Effect of Genetic Polymorphisms on the Rapamycin-regulated Genes is Associated with the Rapamycin Response in Human Lymphocytes from Individual Patients and the Diagnosis of AD

4.1 in Silico Data Mining

Existing databases were analysed to identify the mTOR regulated genes on the chromosomal regions identified to be linked to AD (linkage studies, AlzGene).

The AlzGene database identifies the following chromosomal regions in linkage with AD (Table 12)

TABLE 12

	Chromosome	Location (Mb)	Hamshere et al. (2007) LOD (Mb)	Butler et al. (2009) P-value
30	1p31.1-q31.1	83-185		0.004-0.05
	3q12.3-q25.31	103-173		0.03
	6p21.1-q15	43-91		0.02
	7pter-q21.11	0-78		0.008-0.04
	8p22-p21.1	13-28		0.001
	9p22.3-p13.3	20-35	1.2 (~23 Mb)	
35	9q21.31-q32	80-100	2.5 (~101 Mb)	
	10p14-q24	10-100	3.3 (~61 Mb)	
	17q24.3-qter	67-79		0.03
	19p13.3-qter	8-54	2.0 (~52 Mb)	0.01-0.05

Linkage regions in this table are based on results of the joint and meta-analyses of previously published genome-wide linkage (GWL) data (Hamshere, M. L., P. A. Holmans, et al. (2007). Genome-wide linkage analysis of 723 affected relative pairs with late-onset Alzheimer's disease. *Hum Mol Genet* 16(22): 2703-12; Butler, A. W., M. Y. Ng, et al. (2009). Meta-analysis of linkage studies for Alzheimer's disease—a web resource. *Neurobiol. Aging* 30(7): 1037-47).

Genes on the regions identified by AlzGene to be in linkage with AD were identified from the Ensembl database (<http://www.ensembl.org>). Variations on the genes in the region were identified using BioMart and the Ensembl variation 72 database, the contents of which are incorporated herein in their entirety. The results indicate that 22.17% of rapamycin-regulated genes were found on these AD-related chromosomal regions. Interestingly enough a much smaller number of genes were found to be related to AD in prior studies (see Table 13).

SNPs selected for analysis are shown in Table 14. Further details of each of these SNPs can be found in the NCBI database dbSNP (<http://www.ncbi.nlm.nih.gov/SNP/>). The contents of the dbSNP database entries for each of the SNPs listed in Table 14 are expressly incorporated herein by reference, in particular for the purposes of further defining the location and identity of the SNP.

The SNPs selected were either SNPs on mTOR-sensitive genes or their direct upstream regulators (POU2F1 is a transcriptional regulator of the mTOR genes A2M, CRP, CSF1R, CYP2C9, ESR1, GSTM3, IL2, IL6, PRKAA2, SPP1, TLR4 from Table 1; ADRA1A is a regulator of mTOR regulated genes: CDKN1B, EGR1, FGF7, FN1, IL6, JUN, LOX, NR4A1, NR4A2 from Table 1; LOXL2 is an upstream regulator of mTOR regulated genes: CDH1, FN1, MMP9 from Table 1; PRDM1 is the upstream regulator of mTOR regulated genes: ESR1, IGHG1, IL10, IL2, IL6, MYC, RELN, SCGN from Table 1).

Methods

The rapamycin response in peripheral lymphocytes was measured in 39 patients. The method has been described previously (Yates et al, Dysfunction of the mTOR pathway is a risk factor for Alzheimer's disease, Acta Neuropathological Communications, 2013).

Genomic DNA was extracted from the same lymphocyte samples (using established protocols). Primers were designed for the SNPs in Table 13 using Primer3 tool. PCR was carried out using the 2x Reddymix PCR master mix (Thermo scientific, AB-0575/DC/LD/B) with a final composition of: 0.625 units ThermoPrime Taq DNA polymerase, 75 mM Tris-HCl (pH 8.8 at 25° C.), 20 mM (NH₄)₂SO₄, 1.5Mm MgCl₂, 0.01% (v/v) Tween 20, 0.2 mM each of dATP, dCTP, dGTP and dTTP, and precipitant and red dye for electrophoresis.

40

PCR mix was assembled as follows:

P21 ex2 (Forward Primer)	0.2 µl
P21 ex2' (Reverse Primer)	0.2 µl
Nuclease free water	15.6 µl
2 x Reddy Mix PCR master mix	20 µl

45

The reagents were added in the volumes as stated above to give a 36 µl 'Master Mix'. The Master Mix is dispensed in 36 µl aliquots, to which is added 4 µl of test DNA. The PCR was carried out as follows: 95° C. for 5 minutes, followed by 40 cycles of 95° C. for 60 sec, 57° C. for 60 sec and 72° C. for 60 sec.

55

Following the PCR 4 µl of each sample was denatured in 12 µl SSCP denaturing solution (95% Formamide, 10 mM NaOH, 0.01% w/v xylene cyanole and 0.01% w/v bromophenol blue). Samples were denatured at 95° C. for 6 minutes and placed on ice for at least 10 minutes. Gel electrophoresis was performed using 3% Metaphore agarose +0.5% multipurpose agarose gels, at 400 V for 45 minutes.

60

The SNPs on the samples lead to single stranded variants that ran at different speeds on the gel (SSCP analysis).

65

The variant with the lower frequency was regarded the minor allele and labelled "1"; while the more frequent allele was labelled "0".

US 9,944,986 B2

93

4.2 Minor allele frequencies and the association of these alleles with AD.

As the Chi-squared analyses indicated, none of the SNPs investigated was significantly associated on their own with the diagnosis of AD (see Tables 15-29).

However, when combinations of SNPs were investigated, it was found that different combinations of SNPs were significantly associated with the rapamycin response of the individual patient as measured from lymphocytes.

The increase in cell death elicited by rapamycin in the lymphocytes was significantly associated with the combination of pr4, pr1 and pr15 (Table 30).

Significance level	P < 0.001				

The ‘efficacy of Rapamycin’ in the lymphocyte cultures was also calculated from the combined effect on cell proliferation time and relative lengthening of the G1 time. This estimate was based on idealised cell culture models. The resulting value was significantly associated with a combination of pr4, pr12, pr10 and pr15 (Table 41).

Significance level	P = 0.001				

4.3 the Association of the Variants on Rapamycin-sensitive Genes with AD.

Logistic regression indicates that a combination of pr1, pr10 and plasma homocysteine levels are significantly associated with the diagnosis of AD. The prediction from the model would allow the correct classification of 77.4% of the patients (AUC) (Table 42).

65	In summary the data presented indicate that the rapamycin response in peripheral lymphocytes from individual patients is the result of the combination of SNPs on the rapamycin-sensitive genes. The data also show that this genetic association is strongly dependent on an environmental risk factor that has an influence on cell proliferation and cell cycle characteristics, and is itself an independent risk factor for AD.				
70	The present invention is not to be limited in scope by the specific embodiments described herein. Indeed, various modifications of the invention in addition to those described herein will become apparent to those skilled in the art from the foregoing description and accompanying figures. Such modifications are intended to fall within the scope of the appended claims. Moreover, all aspects and embodiments of the invention described herein are considered to be broadly applicable and combinable with any and all other consistent embodiments, including those taken from other aspects of the invention (including in isolation) as appropriate.				
75	Various publications are cited herein, the disclosures of which are incorporated by reference in their entireties.

20

The invention claimed is:

1. A method for detection of a combination of human single nucleotide polymorphisms (SNPs) in a human subject, comprising

- a) obtaining a nucleic acid sample from said human subject;
- b) genotyping the sample for a combination of SNPs in rapamycin-sensitive gene(s) FAM5C, CRP, SYK, and ADRA1A, said combination of SNP alleles being rs725106 (A), rs1148613 (C), rs1341665 (A), rs290258 (G) and rs2036108 (T); and
- c) detecting in said nucleic acid sample from said human subject the presence of an A for rs725106, a C for

rs1148613, an A for rs1341665, a G for rs290258 and a T for rs2036108.

2. The method of claim 1, further comprising detection of one or more SNP alleles selected from rs798893 (C), rs1532278 (C), rs1801274 (G), rs811925 (G), rs883524 (C), rs1065457 (G), rs295 (C), rs365836 (G), rs1359059 (A), and rs569214 (T).

3. The method of claim 2, wherein rs798893 (C) is detected.

4. The method of claim 2, where all SNP alleles are detected.
